RE: Nez Perce-Clearwater National Forest Plan Revision Draft Environmental I Statement

To Whom It May Concern:

The Idaho Cattle Association (ICA) submits the following comments regarding the Ne Perce-Clearwater National Forest Plan Revision Draft Environmental Impact Stateme (DEIS) on behalf of the ranchers who have permits to graze livestock within the Nez Clearwater National Forest and whose livelihoods are dependent upon the ability to continue grazing on public lands.

Beyond our dependency on use of the public lands to sustain our industry and our m livestock operations, we, along with our members and employees, rely upon the publ within the Nez Perce-Clearwater National Forest area to maintain the custom and cu public land livestock grazing, to recreate, and to otherwise enjoy the open space and of life that the public lands and associated private and state lands provide us, as well members and employees.

General Comments

In general, continued grazing use of public lands is critical to the continued functioni the livestock industry in Idaho and across the west. Concurrently, livestock grazing c provide great benefit to the landscape on which it is applied and to the surrounding communities.

The Forest Service is mandated, through the Federal Land Policy and Management A (FLPMA), to manage the land for multiple use and sustained yield, protect valid exist rights, and consider the needs of the adjacent communities. Livestock grazing is a vit component of both multiple use and sound land management. Thus, the forest plan s be more complete in acknowledging its value. Rather than approaching the manager the allotments contained within the Nez Perce Clearwater Forest from the erroneous

assumption that livestock grazing has negative effects on the landscape, the Forest S ϵ should instead be considering ways in which it may more efficiently manage grazing cooperation with the permittees to maximize available AUMs, which can be done eff ϵ

in harmony with other landscape values, and can particularly provide fuels reductior benefits—which are so necessary across this landscape. Below are more detailed con on how this can be accomplished.

Value of Grazing

The forest plan should facilitate continued livestock grazing use across the landscape the Nez-Perce Clearwater National Forest. Livestock grazing provides many benefits Ranchers are the stewards of the ecosystem on both the private and public land they They provide an effective line of defense against fire and noxious weeds, manage for optimum production, and are the primary protectors of open space in the private lan the west. Without the presence of livestock grazing, and the permittees who own an manage the livestock, large areas of wildlife habitat would be in jeopardy. The benefi provided by ranching relate directly to several identified concerns including wildfire invasive plants, and urbanization and development.

Fuels Management

Livestock grazing can be an effective tool in managing the threat of catastrophic wild is documented that any reduction in grazing intensity, such as a reduction in the utili level or total AUMs to be utilized in an area, will cause a relative increase in the fine f load. This increases the risk of fire ignition and the likelihood that a fire will burn wi greater intensity, cause more damage, and encompass larger areas. The forest plan s acknowledge the benefit of continued livestock grazing to fuels reduction. The plan s provide methods for incorporating the use of grazing as a tool for fuels management.

Flexibility

A forest plan should be a guidance document that promotes sound management but a on-the-ground decisions to be made at the local level and not pre-determined on a br basis. The DEIS lists the current amount of AUMs within the Forest. We encourage tl incorporation of language that states that AUM levels are determined based on range production values and can increase as needed. The forest plan should not have an up limit but should allow the AUM level to be modified over time based on site-specific conditions.

Stubble Height Requirements

It is not appropriate at this level for the Forest Service to dictate specific managemen such as stubble height requirements. Those decisions should be left to the land mana the local level where determinations about impacts and the appropriate prescription be made at the localized, site-specific level. The six-inch stubble height requirement riparian areas is particularly concerning. While various studies have identified varyi ranges of stubble height to meet specific objectives in specific riparian areas, there is peer-reviewed or accepted research that a six-inch stubble height is required to man healthy stream banks across the forest. Appropriate stubble height varies by plant sj and herbaceous species may not be present on all stream reaches due to site potentia forest must also include clarification that "end of season" stubble height should be monitored at the end of the growing season and be based on site potential. It is impe that this guideline is removed and that stubble height requirements are managed at t specific scale based on management objectives and site potential.

Grazing Restrictions in Fish Habitat

The DEIS requires the implementation of measures to be included in grazing annual operating instructions. This broad guideline must be removed. The Forest Service is required to apply measures for all native fish, therefore making this guideline arbitra unwarranted. This would have a significant and unwarranted impact on grazing periwithin the forest. Any measures implemented should only be initiated through the r Section 7 ESA consultation during the authorization or reauthorization of grazing period for the forest regarding ESA fish species arise in Section 7 consultation, guidelines for H species should be implemented at that time and on the site-specific scale.

Socio-Economic Impacts

The Forest Service must consider not only the environmental consequences in their analysis, but also the impacts to the human environment and economy, including gra grazing permits are reduced, the negative economic impact to the surrounding area to be significant and it is important that the final EIS acknowledge this. The limited soce economic review in the DEIS entirely fails to adequately consider the value of a ranch local economy and the trickledown effect that a lost AUM causes to an entire rural community. In Idaho, where well over half of the land is federally-owned, countless 1 communities rely on public lands grazing for their tax base, commerce, and jobs. Few industries in western rural communities are as stabilizing and longstanding. Ranchen provide seasonal and year-round jobs, bring steady, reliable business to local supply and other services, and provide a tax base for rural community, for example, a 25% reliable at a 5.4% loss of jobs.

Conclusion

Thank you for providing the opportunity to comment on this DEIS. We hope that you able to incorporate and address our concerns prior to the document being final. Ple
