

BARC Phase 2 Map
Mangum Fire

The majority of the "High" severity areas on this Burned Area Reflectance Classification map are places where we have not implemented thinning or prescribed fire. The areas that have been treated show as "Unchanged" or "Low" severity for the most part. This country can handle fire under hot, dry, and windy conditions if the fuels are treated. Taken from an email from Andrew Leindecker, Kaibab NF Fire and Fuels Specialist (June 24, 2020)

Severity Level	Acres	Percent
Unchanged	6,187	9%
Low	24,496	36%
Moderate	32,463	48%
High	4,145	6%
Total	67,291	100%
