

Greetings Ms. Jackson and Staff,

I have reviewed the Plan of Restoration and Operations and met with members of Midas Gold Idaho to better understand the company's plans for the Stibnite Gold Project. Below are my comments on the plan to be included in the comment period.

As it stands today, the Stibnite Gold Project site is a brownfield site. The U.S. government tried to restore the area years ago but the work that was done didn't go far enough. The old tailings piles left by previous mining companies are still unconstrained and therefore present a risk of leaching minerals into nearby streams and the groundwater. Under Alternative 2, Midas Gold will pick up and reprocess these legacy tailings, which will reduce long-term metal loading in the ground and surface water (DEIS 4.9). This would be a huge win for the site because today arsenic and antimony levels far exceed human health standards at multiple points across the site. Midas Gold's water treatment during operations will further lower levels of these metals in the river and cause concentrations to be below the current baseline conditions (DEIS 4.9-70). Each year, hundreds of tons of sediment continue to be dumped into the East Fork of the South Fork of the Salmon River and other waterways from Blowout Creek, impacting water quality and aquatic habitat. And fish still are not able to swim past the Yellow Pine pit to their natural spawning grounds. When fish are reconnected to more habitat upstream, 4.2-39 of the DEIS shows it will increase productivity and diversity of these isolated populations. This area needs to be remediated and Midas Gold has a plan to do it the right way.

I hope the U.S. Forest Service will realize the benefits this project and permit the Stibnite Gold Project using alternative 2.

Thanks for your time,

Name: Susan Jacobus
