

Hi there,

I want to shed some light on the idea that The Stibnite project will reprocess the tailings of the previous mining companies' operations using modern methods that will restrict and contain the flow of the metallurgy by-products into the water system.

It seems as though the only solution to reduce or remove the metallurgy products from the water and the surrounding ecosystems is to reprocess these grounds. Understanding that Midas has the possibility to do this, I can see this as the only solution for the Nez Perce Tribe to have their water system returned back to its original condition.

If not to its original condition then to a state that was better than it is today.

Good luck to the Midas Gold who has this amazing opportunity to reverse the negative image gold mining has had on the environment, in this community, and to be the solution to the situation that everyone in the community are facing.

Mr A Thomas
