

Hello,

Thank you for the opportunity to comment during the Draft EIS period for the Stibnite Gold Project.

Today at the site, leftover mining waste is leaching metals into groundwater and hurting wildlife and local communities. Midas has been monitoring the site for the last decade and discovered there are high levels of arsenic and antimony in the water, far beyond what is acceptable for drinking water standards. Of course, these problems were created long ago by historical mining operations and not by Midas Gold. However, the company has a plan to address these problems. Alternative 2 offers viable solutions to improve the site. It creates a plan to clean up existing tailings and store future tailings in a state-of-the-art storage facility. I trust Midas to safely reprocess and store the tailings because their facility contains several important design factors to prevent against breaches, leaks, or excessive water accumulation.

Thank you for the thorough review of the Stibnite Gold Project. I urge you to now move forward and permit the mine using alternative 2, so Midas Gold can put Americans back to work.

Best Wishes,

Randy C McFatridge
