

Greetings,

Thank you for the opportunity to provide my feedback as part of Midas Gold Idaho's public permitting process.

The site is rich in gold deposits but it also has antimony, which was recently deemed a critical by the federal government. Antimony is used as a fire retardant and metal strengthener. It is used in everything from batteries, textiles, cell phones, plastics and cable sheathing. Right now, the U.S. doesn't have a domestic antimony mine. The Stibnite Gold Project could provide one-quarter of the American demand for antimony in the country. This is so important with the current tenuous trade relations in our country.

The comment period for the project was already extended once. The U.S. Forest Service has given the public more than adequate time to comment, plus tools that make reviewing the document easy and a virtual meeting room to make information more digestible. It is with this knowledge that I encourage the U.S. Forest Service to continue to move the project forward and permit the site using alternative 2 as the guide.

Respectfully,

Name: John McClernan
