

Forest Supervisor
Carrie Gilbert,

Once more I make an appeal to you for the well being of the people along Symmes Creek. If you decide to remove large areas of full grown trees and brush vegetation on the hill sides of Wayne National Forest and it rains, which it will, there will be nothing to hold the land from washing away causing land slides which will also cause the water to be deeper in Symmes Creek.

At this time houses that 13 years ago were not in the flood plain now they are. How many more homes and lives will be in danger after hundreds of acres of land are clear cut. How can this be an improvement?

Now we are told you plan to spray hundred acres with chemicals containing glyphosate, a chemical contained in round up.

The Monsanto Co. has already had to pay out millions of dollars to people dying from using this product. How many people are you willing to kill with chemicals to clear the forest of vegetation. What about visitors to the forest just walking through these chemicals? How many children will become sick from touching a plant after being sprayed.

Maybe it would be a good idea to rethink this project before you make mistakes that cost lives.

No amount of money is enough to replace one human being. Our children are worth more than the few dollars each county would receive from any timber. Please consider the consequences.
