

Public participation is a huge part of the permitting process and I appreciate the opportunity to share my thoughts on the SDEIS. This project is important to me because it can provide America with a domestically mined source of antimony and restore an abandoned mine site in need of repair.

Perpetua Resources has a clear plan to clean up legacy issues in the historic Stibnite Mining District. The company has recently made improvements to their plans that reduce the project footprint, improve water quality and keep water temperatures at or below current conditions. This will improve fish habitat, water quality and safely store old mine waste. Along with restoring the site, the Stibnite Gold Project will produce the only domestically mined supply of antimony. Currently, China is the top producer of this mineral. If the Stibnite Gold Project moves forward, the United States can become less reliant on other countries. Creating a domestic source of antimony will also be beneficial for America's green future. Sourcing antimony within the U.S. will result in lower carbon emissions as we will not need to transport the mineral from China into the U.S. Mining standards in the U.S. are also more protective of the environment.

I believe the the Stibnite Gold Project is the new standard for extraction mining, to leave a site better than it was, and cleaning up a historical mining mess is the new direction.

The Stibnite Gold Project is important to Idaho, our national security and clean energy future. Regulators have been reviewing the project for the past 6 years. This time has allowed the project to improve and, now, I encourage you to permit the project as quickly as possible.
