

The Stibnite Gold Project presents a big opportunity for Idaho. Without this project, the conditions at Stibnite will likely never get better. Fish will continue to be blocked from their spawning grounds by an abandoned mine pit and legacy tailings will continue to degrade water quality. The project also presents an opportunity for America. It could help secure a domestic source of antimony, so we can stop our import reliance on this critical mineral. This is an important project and I appreciate the opportunity to provide my feedback as part of Perpetua Resources' public permitting process.

Last summer, Perpetua agreed to provide antimony to largescale battery maker Ambri. The agreement establishes a foundation to help facilitate the decarbonization of energy grids in the U.S. as well as around the globe. Ambri's batteries could fundamentally change how our energy system operates by making it possible for power grids to rely on more power from the wind and sun. The Stibnite Gold Project is key to making this happen because it would be America's only mined source of antimony. Without it, we will continue to have to rely on China and Russia for this critical mineral. I want to support America's clean energy transition and supporting the Stibnite Gold Project using Burntlog Road is one of the best ways I can do that.

The SDEIS reduces the size of the project footprint, improves water quality, eliminates the need for long-term water treatment and makes sure water temperature on site does not exceed baseline conditions – all while providing our nation with access to a mineral we desperately need. The permitting process has been thorough and complete. Now, I hope the U.S. Forest Service will realize the benefits this project and permit the Stibnite Gold Project using the 2021 Modified Mine Plan.
