

I have been following Perpetua's plan to mine Antimony Tri sulfide, gold, and silver at the Stibnite Project for years. This would provide hundreds of living wage jobs and the financial resources to restore an area that has been in need of cleanup since WWII and the Korean War. Perpetua did not cause the environmental damage from past mining but they've already begun a good faith effort to improve the site. They have delivered on their promises to Valley County Idaho, and the local communities for years now, and have other improvements planned to roads, intersections, and power lines.

Data has shown that four species of fish will permanently benefit from the stream restoration, while creatively eliminating the need for long term water treatment.

Ambri is a new company focused on providing low cost Liquid Metal battery storage for solar and wind power, but they can't do it without Antimony. Perpetua is also focused on providing them a stable domestic supply of this critical mineral, but they can't do it without

the permitting process moving forward. Please consider all the benefits that this Stibnite Gold Project will deliver to citizens in Idaho, and the United States.
