I am pleased that the U.S. Forest Service is preparing to amend the Northwest Forest Plan, which remains one of the most important pieces of forest management policy in the United States. The 17 national forests governed by the plan are vital for the wellbeing of both people and wildlife in the region—in addition to offering numerous ecosystem services like clean air and water, they provide local communities with many tangible economic benefits. As such, an amendment to the Northwest Forest Plan should consider the needs of both people and the environment.

An amendment to the Northwest Forest Plan should pay particular attention to protecting mature and old-growth forests, which were not equally protected by the initial policy. These older forests offer unique habitat that species like the northern spotted owl and salmon need for survival, and are culturally important for many different communities—including Tribal Nations. These forests are increasingly rare in the United States, and face escalating threats from climate change impacts like fire, drought and insect damage.

To that end, an amendment should take specific steps to address severe wildfires. Since the Northwest Forest Plan's initial development, wildfires have grown exponentially in size, strength and frequency—far surpassing expectations. The Forest Service should reassess current management strategies in light of escalating wildfire threats and consider incorporating Indigenous cultural burning practices. In general, consultation with local Tribal Nations and incorporation of Indigenous Knowledge will be critical steps for the Forest Service to take in amending the Northwest Forest Plan.

Lastly, an amendment should consider the Pacific Northwest's current socioeconomic landscape and the importance that national forests play in the regional economy. Tourism and recreation draw more people to the region than ever before, spurring job creation and growth in rural economies. An amendment should be sensitive to the socioeconomic needs of local communities and build a modern forest restoration workforce to protect these forests for generations to come.

Thank you for considering local voices in amending the Northwest Forest Plan.

Papillion, NE 68046-4861

I am pleased that the U.S. Forest Service is preparing to amend the Northwest Forest Plan, which remains one of the most important pieces of forest management policy in the United States. The 17 national forests governed by the plan are vital for the wellbeing of both people and wildlife in the region—in addition to offering numerous ecosystem services like clean air and water, they provide local communities with many tangible economic benefits. As such, an amendment to the Northwest Forest Plan should consider the needs of both people and the environment.

An amendment to the Northwest Forest Plan should pay particular attention to protecting mature and old-growth forests, which were not equally protected by the initial policy. These older forests offer unique habitat that species like the northern spotted owl and salmon need for survival, and are culturally important for many different communities—including Tribal Nations. These forests are increasingly rare in the United States, and face escalating threats from climate change impacts like fire, drought and insect damage.

To that end, an amendment should take specific steps to address severe wildfires. Since the Northwest Forest Plan's initial development, wildfires have grown exponentially in size, strength and frequency—far surpassing expectations. The Forest Service should reassess current management strategies in light of escalating wildfire threats and consider incorporating Indigenous cultural burning practices. In general, consultation with local Tribal Nations and incorporation of Indigenous Knowledge will be critical steps for the Forest Service to take in amending the Northwest Forest Plan.

Lastly, an amendment should consider the Pacific Northwest's current socioeconomic landscape and the importance that national forests play in the regional economy. Tourism and recreation draw more people to the region than ever before, spurring job creation and growth in rural economies. An amendment should be sensitive to the socioeconomic needs of local communities and build a modern forest restoration workforce to protect these forests for generations to come.

Thank you for considering local voices in amending the Northwest Forest Plan.

Rolla, MO 65401-8466

I am pleased that the U.S. Forest Service is preparing to amend the Northwest Forest Plan, which remains one of the most important pieces of forest management policy in the United States. The 17 national forests governed by the plan are vital for the wellbeing of both people and wildlife in the region—in addition to offering numerous ecosystem services like clean air and water, they provide local communities with many tangible economic benefits. As such, an amendment to the Northwest Forest Plan should consider the needs of both people and the environment.

An amendment to the Northwest Forest Plan should pay particular attention to protecting mature and old-growth forests, which were not equally protected by the initial policy. These older forests offer unique habitat that species like the northern spotted owl and salmon need for survival, and are culturally important for many different communities—including Tribal Nations. These forests are increasingly rare in the United States, and face escalating threats from climate change impacts like fire, drought and insect damage.

To that end, an amendment should take specific steps to address severe wildfires. Since the Northwest Forest Plan's initial development, wildfires have grown exponentially in size, strength and frequency—far surpassing expectations. The Forest Service should reassess current management strategies in light of escalating wildfire threats and consider incorporating Indigenous cultural burning practices. In general, consultation with local Tribal Nations and incorporation of Indigenous Knowledge will be critical steps for the Forest Service to take in amending the Northwest Forest Plan.

Lastly, an amendment should consider the Pacific Northwest's current socioeconomic landscape and the importance that national forests play in the regional economy. Tourism and recreation draw more people to the region than ever before, spurring job creation and growth in rural economies. An amendment should be sensitive to the socioeconomic needs of local communities and build a modern forest restoration workforce to protect these forests for generations to come.

Thank you for considering local voices in amending the Northwest Forest Plan.

Montesano, WA 98563-3411

I am pleased that the U.S. Forest Service is preparing to amend the Northwest Forest Plan, which remains one of the most important pieces of forest management policy in the United States. The 17 national forests governed by the plan are vital for the wellbeing of both people and wildlife in the region—in addition to offering numerous ecosystem services like clean air and water, they provide local communities with many tangible economic benefits. As such, an amendment to the Northwest Forest Plan should consider the needs of both people and the environment.

An amendment to the Northwest Forest Plan should pay particular attention to protecting mature and old-growth forests, which were not equally protected by the initial policy. These older forests offer unique habitat that species like the northern spotted owl and salmon need for survival, and are culturally important for many different communities—including Tribal Nations. These forests are increasingly rare in the United States, and face escalating threats from climate change impacts like fire, drought and insect damage.

To that end, an amendment should take specific steps to address severe wildfires. Since the Northwest Forest Plan's initial development, wildfires have grown exponentially in size, strength and frequency—far surpassing expectations. The Forest Service should reassess current management strategies in light of escalating wildfire threats and consider incorporating Indigenous cultural burning practices. In general, consultation with local Tribal Nations and incorporation of Indigenous Knowledge will be critical steps for the Forest Service to take in amending the Northwest Forest Plan.

Lastly, an amendment should consider the Pacific Northwest's current socioeconomic landscape and the importance that national forests play in the regional economy. Tourism and recreation draw more people to the region than ever before, spurring job creation and growth in rural economies. An amendment should be sensitive to the socioeconomic needs of local communities and build a modern forest restoration workforce to protect these forests for generations to come.

Thank you for considering local voices in amending the Northwest Forest Plan.

Eugene, OR 97404-2610

I am pleased that the U.S. Forest Service is preparing to amend the Northwest Forest Plan, which remains one of the most important pieces of forest management policy in the United States. The 17 national forests governed by the plan are vital for the wellbeing of both people and wildlife in the region—in addition to offering numerous ecosystem services like clean air and water, they provide local communities with many tangible economic benefits. As such, an amendment to the Northwest Forest Plan should consider the needs of both people and the environment.

An amendment to the Northwest Forest Plan should pay particular attention to protecting mature and old-growth forests, which were not equally protected by the initial policy. These older forests offer unique habitat that species like the northern spotted owl and salmon need for survival, and are culturally important for many different communities—including Tribal Nations. These forests are increasingly rare in the United States, and face escalating threats from climate change impacts like fire, drought and insect damage.

To that end, an amendment should take specific steps to address severe wildfires. Since the Northwest Forest Plan's initial development, wildfires have grown exponentially in size, strength and frequency—far surpassing expectations. The Forest Service should reassess current management strategies in light of escalating wildfire threats and consider incorporating Indigenous cultural burning practices. In general, consultation with local Tribal Nations and incorporation of Indigenous Knowledge will be critical steps for the Forest Service to take in amending the Northwest Forest Plan.

Lastly, an amendment should consider the Pacific Northwest's current socioeconomic landscape and the importance that national forests play in the regional economy. Tourism and recreation draw more people to the region than ever before, spurring job creation and growth in rural economies. An amendment should be sensitive to the socioeconomic needs of local communities and build a modern forest restoration workforce to protect these forests for generations to come.

Thank you for considering local voices in amending the Northwest Forest Plan.

I am pleased that the U.S. Forest Service is preparing to amend the Northwest Forest Plan, which remains one of the most important pieces of forest management policy in the United States. The 17 national forests governed by the plan are vital for the wellbeing of both people and wildlife in the region—in addition to offering numerous ecosystem services like clean air and water, they provide local communities with many tangible economic benefits. As such, an amendment to the Northwest Forest Plan should consider the needs of both people and the environment.

An amendment to the Northwest Forest Plan should pay particular attention to protecting mature and old-growth forests, which were not equally protected by the initial policy. These older forests offer unique habitat that species like the northern spotted owl and salmon need for survival, and are culturally important for many different communities—including Tribal Nations. These forests are increasingly rare in the United States, and face escalating threats from climate change impacts like fire, drought and insect damage.

To that end, an amendment should take specific steps to address severe wildfires. Since the Northwest Forest Plan's initial development, wildfires have grown exponentially in size, strength and frequency—far surpassing expectations. The Forest Service should reassess current management strategies in light of escalating wildfire threats and consider incorporating Indigenous cultural burning practices. In general, consultation with local Tribal Nations and incorporation of Indigenous Knowledge will be critical steps for the Forest Service to take in amending the Northwest Forest Plan.

Lastly, an amendment should consider the Pacific Northwest's current socioeconomic landscape and the importance that national forests play in the regional economy. Tourism and recreation draw more people to the region than ever before, spurring job creation and growth in rural economies. An amendment should be sensitive to the socioeconomic needs of local communities and build a modern forest restoration workforce to protect these forests for generations to come.

Thank you for considering local voices in amending the Northwest Forest Plan.

I am pleased that the U.S. Forest Service is preparing to amend the Northwest Forest Plan, which remains one of the most important pieces of forest management policy in the United States. The 17 national forests governed by the plan are vital for the wellbeing of both people and wildlife in the region—in addition to offering numerous ecosystem services like clean air and water, they provide local communities with many tangible economic benefits. As such, an amendment to the Northwest Forest Plan should consider the needs of both people and the environment.

An amendment to the Northwest Forest Plan should pay particular attention to protecting mature and old-growth forests, which were not equally protected by the initial policy. These older forests offer unique habitat that species like the northern spotted owl and salmon need for survival, and are culturally important for many different communities—including Tribal Nations. These forests are increasingly rare in the United States, and face escalating threats from climate change impacts like fire, drought and insect damage.

To that end, an amendment should take specific steps to address severe wildfires. Since the Northwest Forest Plan's initial development, wildfires have grown exponentially in size, strength and frequency—far surpassing expectations. The Forest Service should reassess current management strategies in light of escalating wildfire threats and consider incorporating Indigenous cultural burning practices. In general, consultation with local Tribal Nations and incorporation of Indigenous Knowledge will be critical steps for the Forest Service to take in amending the Northwest Forest Plan.

Lastly, an amendment should consider the Pacific Northwest's current socioeconomic landscape and the importance that national forests play in the regional economy. Tourism and recreation draw more people to the region than ever before, spurring job creation and growth in rural economies. An amendment should be sensitive to the socioeconomic needs of local communities and build a modern forest restoration workforce to protect these forests for generations to come.

Thank you for considering local voices in amending the Northwest Forest Plan.

San Antonio, TX 78255-1200

I am pleased that the U.S. Forest Service is preparing to amend the Northwest Forest Plan, which remains one of the most important pieces of forest management policy in the United States. The 17 national forests governed by the plan are vital for the wellbeing of both people and wildlife in the region—in addition to offering numerous ecosystem services like clean air and water, they provide local communities with many tangible economic benefits. As such, an amendment to the Northwest Forest Plan should consider the needs of both people and the environment.

An amendment to the Northwest Forest Plan should pay particular attention to protecting mature and old-growth forests, which were not equally protected by the initial policy. These older forests offer unique habitat that species like the northern spotted owl and salmon need for survival, and are culturally important for many different communities—including Tribal Nations. These forests are increasingly rare in the United States, and face escalating threats from climate change impacts like fire, drought and insect damage.

To that end, an amendment should take specific steps to address severe wildfires. Since the Northwest Forest Plan's initial development, wildfires have grown exponentially in size, strength and frequency—far surpassing expectations. The Forest Service should reassess current management strategies in light of escalating wildfire threats and consider incorporating Indigenous cultural burning practices. In general, consultation with local Tribal Nations and incorporation of Indigenous Knowledge will be critical steps for the Forest Service to take in amending the Northwest Forest Plan.

Lastly, an amendment should consider the Pacific Northwest's current socioeconomic landscape and the importance that national forests play in the regional economy. Tourism and recreation draw more people to the region than ever before, spurring job creation and growth in rural economies. An amendment should be sensitive to the socioeconomic needs of local communities and build a modern forest restoration workforce to protect these forests for generations to come.

Thank you for considering local voices in amending the Northwest Forest Plan.

I am pleased that the U.S. Forest Service is preparing to amend the Northwest Forest Plan, which remains one of the most important pieces of forest management policy in the United States. The 17 national forests governed by the plan are vital for the wellbeing of both people and wildlife in the region—in addition to offering numerous ecosystem services like clean air and water, they provide local communities with many tangible economic benefits. As such, an amendment to the Northwest Forest Plan should consider the needs of both people and the environment.

An amendment to the Northwest Forest Plan should pay particular attention to protecting mature and old-growth forests, which were not equally protected by the initial policy. These older forests offer unique habitat that species like the northern spotted owl and salmon need for survival, and are culturally important for many different communities—including Tribal Nations. These forests are increasingly rare in the United States, and face escalating threats from climate change impacts like fire, drought and insect damage.

To that end, an amendment should take specific steps to address severe wildfires. Since the Northwest Forest Plan's initial development, wildfires have grown exponentially in size, strength and frequency—far surpassing expectations. The Forest Service should reassess current management strategies in light of escalating wildfire threats and consider incorporating Indigenous cultural burning practices. In general, consultation with local Tribal Nations and incorporation of Indigenous Knowledge will be critical steps for the Forest Service to take in amending the Northwest Forest Plan.

Lastly, an amendment should consider the Pacific Northwest's current socioeconomic landscape and the importance that national forests play in the regional economy. Tourism and recreation draw more people to the region than ever before, spurring job creation and growth in rural economies. An amendment should be sensitive to the socioeconomic needs of local communities and build a modern forest restoration workforce to protect these forests for generations to come.

Thank you for considering local voices in amending the Northwest Forest Plan.

Hammond, LA 70404-1563

I am pleased that the U.S. Forest Service is preparing to amend the Northwest Forest Plan, which remains one of the most important pieces of forest management policy in the United States. The 17 national forests governed by the plan are vital for the wellbeing of both people and wildlife in the region—in addition to offering numerous ecosystem services like clean air and water, they provide local communities with many tangible economic benefits. As such, an amendment to the Northwest Forest Plan should consider the needs of both people and the environment.

An amendment to the Northwest Forest Plan should pay particular attention to protecting mature and old-growth forests, which were not equally protected by the initial policy. These older forests offer unique habitat that species like the northern spotted owl and salmon need for survival, and are culturally important for many different communities—including Tribal Nations. These forests are increasingly rare in the United States, and face escalating threats from climate change impacts like fire, drought and insect damage.

To that end, an amendment should take specific steps to address severe wildfires. Since the Northwest Forest Plan's initial development, wildfires have grown exponentially in size, strength and frequency—far surpassing expectations. The Forest Service should reassess current management strategies in light of escalating wildfire threats and consider incorporating Indigenous cultural burning practices. In general, consultation with local Tribal Nations and incorporation of Indigenous Knowledge will be critical steps for the Forest Service to take in amending the Northwest Forest Plan.

Lastly, an amendment should consider the Pacific Northwest's current socioeconomic landscape and the importance that national forests play in the regional economy. Tourism and recreation draw more people to the region than ever before, spurring job creation and growth in rural economies. An amendment should be sensitive to the socioeconomic needs of local communities and build a modern forest restoration workforce to protect these forests for generations to come.

Thank you for considering local voices in amending the Northwest Forest Plan.

I am pleased that the U.S. Forest Service is preparing to amend the Northwest Forest Plan, which remains one of the most important pieces of forest management policy in the United States. The 17 national forests governed by the plan are vital for the wellbeing of both people and wildlife in the region—in addition to offering numerous ecosystem services like clean air and water, they provide local communities with many tangible economic benefits. As such, an amendment to the Northwest Forest Plan should consider the needs of both people and the environment.

An amendment to the Northwest Forest Plan should pay particular attention to protecting mature and old-growth forests, which were not equally protected by the initial policy. These older forests offer unique habitat that species like the northern spotted owl and salmon need for survival, and are culturally important for many different communities—including Tribal Nations. These forests are increasingly rare in the United States, and face escalating threats from climate change impacts like fire, drought and insect damage.

To that end, an amendment should take specific steps to address severe wildfires. Since the Northwest Forest Plan's initial development, wildfires have grown exponentially in size, strength and frequency—far surpassing expectations. The Forest Service should reassess current management strategies in light of escalating wildfire threats and consider incorporating Indigenous cultural burning practices. In general, consultation with local Tribal Nations and incorporation of Indigenous Knowledge will be critical steps for the Forest Service to take in amending the Northwest Forest Plan.

Lastly, an amendment should consider the Pacific Northwest's current socioeconomic landscape and the importance that national forests play in the regional economy. Tourism and recreation draw more people to the region than ever before, spurring job creation and growth in rural economies. An amendment should be sensitive to the socioeconomic needs of local communities and build a modern forest restoration workforce to protect these forests for generations to come.

Thank you for considering local voices in amending the Northwest Forest Plan.

Westfield, MA 01085-4591

I am pleased that the U.S. Forest Service is preparing to amend the Northwest Forest Plan, which remains one of the most important pieces of forest management policy in the United States. The 17 national forests governed by the plan are vital for the wellbeing of both people and wildlife in the region—in addition to offering numerous ecosystem services like clean air and water, they provide local communities with many tangible economic benefits. As such, an amendment to the Northwest Forest Plan should consider the needs of both people and the environment.

An amendment to the Northwest Forest Plan should pay particular attention to protecting mature and old-growth forests, which were not equally protected by the initial policy. These older forests offer unique habitat that species like the northern spotted owl and salmon need for survival, and are culturally important for many different communities—including Tribal Nations. These forests are increasingly rare in the United States, and face escalating threats from climate change impacts like fire, drought and insect damage.

To that end, an amendment should take specific steps to address severe wildfires. Since the Northwest Forest Plan's initial development, wildfires have grown exponentially in size, strength and frequency—far surpassing expectations. The Forest Service should reassess current management strategies in light of escalating wildfire threats and consider incorporating Indigenous cultural burning practices. In general, consultation with local Tribal Nations and incorporation of Indigenous Knowledge will be critical steps for the Forest Service to take in amending the Northwest Forest Plan.

Lastly, an amendment should consider the Pacific Northwest's current socioeconomic landscape and the importance that national forests play in the regional economy. Tourism and recreation draw more people to the region than ever before, spurring job creation and growth in rural economies. An amendment should be sensitive to the socioeconomic needs of local communities and build a modern forest restoration workforce to protect these forests for generations to come.

Thank you for considering local voices in amending the Northwest Forest Plan.

I am pleased that the U.S. Forest Service is preparing to amend the Northwest Forest Plan, which remains one of the most important pieces of forest management policy in the United States. The 17 national forests governed by the plan are vital for the wellbeing of both people and wildlife in the region—in addition to offering numerous ecosystem services like clean air and water, they provide local communities with many tangible economic benefits. As such, an amendment to the Northwest Forest Plan should consider the needs of both people and the environment.

An amendment to the Northwest Forest Plan should pay particular attention to protecting mature and old-growth forests, which were not equally protected by the initial policy. These older forests offer unique habitat that species like the northern spotted owl and salmon need for survival, and are culturally important for many different communities—including Tribal Nations. These forests are increasingly rare in the United States, and face escalating threats from climate change impacts like fire, drought and insect damage.

To that end, an amendment should take specific steps to address severe wildfires. Since the Northwest Forest Plan's initial development, wildfires have grown exponentially in size, strength and frequency—far surpassing expectations. The Forest Service should reassess current management strategies in light of escalating wildfire threats and consider incorporating Indigenous cultural burning practices. In general, consultation with local Tribal Nations and incorporation of Indigenous Knowledge will be critical steps for the Forest Service to take in amending the Northwest Forest Plan.

Lastly, an amendment should consider the Pacific Northwest's current socioeconomic landscape and the importance that national forests play in the regional economy. Tourism and recreation draw more people to the region than ever before, spurring job creation and growth in rural economies. An amendment should be sensitive to the socioeconomic needs of local communities and build a modern forest restoration workforce to protect these forests for generations to come.

Thank you for considering local voices in amending the Northwest Forest Plan.

The 17 national forests governed by the plan are vital for the wellbeing of both people and wildlife in the region—in addition to offering numerous ecosystem services like clean air and water, they provide local communities with many tangible economic benefits. As such, an amendment to the Northwest Forest Plan should consider the needs of both people and the environment.

An amendment to the Northwest Forest Plan should pay particular attention to protecting mature and old-growth forests, which were not equally protected by the initial policy. These older forests offer unique habitat that species like the northern spotted owl and salmon need for survival, and are culturally important for many different communities—including Tribal Nations. These forests are increasingly rare in the United States, and face escalating threats from climate change impacts like fire, drought and insect damage.

To that end, an amendment should take specific steps to address severe wildfires. Since the Northwest Forest Plan's initial development, wildfires have grown exponentially in size, strength and frequency—far surpassing expectations. The Forest Service should reassess current management strategies in light of escalating wildfire threats and consider incorporating Indigenous cultural burning practices. In general, consultation with local Tribal Nations and incorporation of Indigenous Knowledge will be critical steps for the Forest Service to take in amending the Northwest Forest Plan.

Lastly, an amendment should consider the Pacific Northwest's current socioeconomic landscape and the importance that national forests play in the regional economy. Tourism and recreation draw more people to the region than ever before, spurring job creation and growth in rural economies. An amendment should be sensitive to the socioeconomic needs of local communities and build a modern forest restoration workforce to protect these forests for generations to come.

Thank you for considering local voices in amending the Northwest Forest Plan.

Porterville, CA 93257-4063

I am pleased that the U.S. Forest Service is preparing to amend the Northwest Forest Plan, which remains one of the most important pieces of forest management policy in the United States. The 17 national forests governed by the plan are vital for the wellbeing of both people and wildlife in the region—in addition to offering numerous ecosystem services like clean air and water, they provide local communities with many tangible economic benefits. As such, an amendment to the Northwest Forest Plan should consider the needs of both people and the environment.

An amendment to the Northwest Forest Plan should pay particular attention to protecting mature and old-growth forests, which were not equally protected by the initial policy. These older forests offer unique habitat that species like the northern spotted owl and salmon need for survival, and are culturally important for many different communities—including Tribal Nations. These forests are increasingly rare in the United States, and face escalating threats from climate change impacts like fire, drought and insect damage.

To that end, an amendment should take specific steps to address severe wildfires. Since the Northwest Forest Plan's initial development, wildfires have grown exponentially in size, strength and frequency—far surpassing expectations. The Forest Service should reassess current management strategies in light of escalating wildfire threats and consider incorporating Indigenous cultural burning practices. In general, consultation with local Tribal Nations and incorporation of Indigenous Knowledge will be critical steps for the Forest Service to take in amending the Northwest Forest Plan.

Lastly, an amendment should consider the Pacific Northwest's current socioeconomic landscape and the importance that national forests play in the regional economy. Tourism and recreation draw more people to the region than ever before, spurring job creation and growth in rural economies. An amendment should be sensitive to the socioeconomic needs of local communities and build a modern forest restoration workforce to protect these forests for generations to come.

Thank you for considering local voices in amending the Northwest Forest Plan.

Portland, OR 97216-2509

I am pleased that the U.S. Forest Service is preparing to amend the Northwest Forest Plan, which remains one of the most important pieces of forest management policy in the United States. The 17 national forests governed by the plan are vital for the wellbeing of both people and wildlife in the region—in addition to offering numerous ecosystem services like clean air and water, they provide local communities with many tangible economic benefits. As such, an amendment to the Northwest Forest Plan should consider the needs of both people and the environment.

An amendment to the Northwest Forest Plan should pay particular attention to protecting mature and old-growth forests, which were not equally protected by the initial policy. These older forests offer unique habitat that species like the northern spotted owl and salmon need for survival, and are culturally important for many different communities—including Tribal Nations. These forests are increasingly rare in the United States, and face escalating threats from climate change impacts like fire, drought and insect damage.

To that end, an amendment should take specific steps to address severe wildfires. Since the Northwest Forest Plan's initial development, wildfires have grown exponentially in size, strength and frequency—far surpassing expectations. The Forest Service should reassess current management strategies in light of escalating wildfire threats and consider incorporating Indigenous cultural burning practices. In general, consultation with local Tribal Nations and incorporation of Indigenous Knowledge will be critical steps for the Forest Service to take in amending the Northwest Forest Plan.

Lastly, an amendment should consider the Pacific Northwest's current socioeconomic landscape and the importance that national forests play in the regional economy. Tourism and recreation draw more people to the region than ever before, spurring job creation and growth in rural economies. An amendment should be sensitive to the socioeconomic needs of local communities and build a modern forest restoration workforce to protect these forests for generations to come.

Thank you for considering local voices in amending the Northwest Forest Plan.

Bronx, NY 10457-3703

I am pleased that the U.S. Forest Service is preparing to amend the Northwest Forest Plan, which remains one of the most important pieces of forest management policy in the United States. The 17 national forests governed by the plan are vital for the wellbeing of both people and wildlife in the region—in addition to offering numerous ecosystem services like clean air and water, they provide local communities with many tangible economic benefits. As such, an amendment to the Northwest Forest Plan should consider the needs of both people and the environment.

An amendment to the Northwest Forest Plan should pay particular attention to protecting mature and old-growth forests, which were not equally protected by the initial policy. These older forests offer unique habitat that species like the northern spotted owl and salmon need for survival, and are culturally important for many different communities—including Tribal Nations. These forests are increasingly rare in the United States, and face escalating threats from climate change impacts like fire, drought and insect damage.

To that end, an amendment should take specific steps to address severe wildfires. Since the Northwest Forest Plan's initial development, wildfires have grown exponentially in size, strength and frequency—far surpassing expectations. The Forest Service should reassess current management strategies in light of escalating wildfire threats and consider incorporating Indigenous cultural burning practices. In general, consultation with local Tribal Nations and incorporation of Indigenous Knowledge will be critical steps for the Forest Service to take in amending the Northwest Forest Plan.

Lastly, an amendment should consider the Pacific Northwest's current socioeconomic landscape and the importance that national forests play in the regional economy. Tourism and recreation draw more people to the region than ever before, spurring job creation and growth in rural economies. An amendment should be sensitive to the socioeconomic needs of local communities and build a modern forest restoration workforce to protect these forests for generations to come.

Thank you for considering local voices in amending the Northwest Forest Plan.

Rohnert Park, CA 94928

I am pleased that the U.S. Forest Service is preparing to amend the Northwest Forest Plan, which remains one of the most important pieces of forest management policy in the United States. The 17 national forests governed by the plan are vital for the wellbeing of both people and wildlife in the region—in addition to offering numerous ecosystem services like clean air and water, they provide local communities with many tangible economic benefits. As such, an amendment to the Northwest Forest Plan should consider the needs of both people and the environment.

An amendment to the Northwest Forest Plan should pay particular attention to protecting mature and old-growth forests, which were not equally protected by the initial policy. These older forests offer unique habitat that species like the northern spotted owl and salmon need for survival, and are culturally important for many different communities—including Tribal Nations. These forests are increasingly rare in the United States, and face escalating threats from climate change impacts like fire, drought and insect damage.

To that end, an amendment should take specific steps to address severe wildfires. Since the Northwest Forest Plan's initial development, wildfires have grown exponentially in size, strength and frequency—far surpassing expectations. The Forest Service should reassess current management strategies in light of escalating wildfire threats and consider incorporating Indigenous cultural burning practices. In general, consultation with local Tribal Nations and incorporation of Indigenous Knowledge will be critical steps for the Forest Service to take in amending the Northwest Forest Plan.

Lastly, an amendment should consider the Pacific Northwest's current socioeconomic landscape and the importance that national forests play in the regional economy. Tourism and recreation draw more people to the region than ever before, spurring job creation and growth in rural economies. An amendment should be sensitive to the socioeconomic needs of local communities and build a modern forest restoration workforce to protect these forests for generations to come.

Thank you for considering local voices in amending the Northwest Forest Plan.

Tucson, AZ 85719-2739

I am pleased that the U.S. Forest Service is preparing to amend the Northwest Forest Plan, which remains one of the most important pieces of forest management policy in the United States. The 17 national forests governed by the plan are vital for the wellbeing of both people and wildlife in the region—in addition to offering numerous ecosystem services like clean air and water, they provide local communities with many tangible economic benefits. As such, an amendment to the Northwest Forest Plan should consider the needs of both people and the environment.

An amendment to the Northwest Forest Plan should pay particular attention to protecting mature and old-growth forests, which were not equally protected by the initial policy. These older forests offer unique habitat that species like the northern spotted owl and salmon need for survival, and are culturally important for many different communities—including Tribal Nations. These forests are increasingly rare in the United States, and face escalating threats from climate change impacts like fire, drought and insect damage.

To that end, an amendment should take specific steps to address severe wildfires. Since the Northwest Forest Plan's initial development, wildfires have grown exponentially in size, strength and frequency—far surpassing expectations. The Forest Service should reassess current management strategies in light of escalating wildfire threats and consider incorporating Indigenous cultural burning practices. In general, consultation with local Tribal Nations and incorporation of Indigenous Knowledge will be critical steps for the Forest Service to take in amending the Northwest Forest Plan.

Lastly, an amendment should consider the Pacific Northwest's current socioeconomic landscape and the importance that national forests play in the regional economy. Tourism and recreation draw more people to the region than ever before, spurring job creation and growth in rural economies. An amendment should be sensitive to the socioeconomic needs of local communities and build a modern forest restoration workforce to protect these forests for generations to come.

Thank you for considering local voices in amending the Northwest Forest Plan.

Ann Arbor, MI 48108-3259

I am pleased that the U.S. Forest Service is preparing to amend the Northwest Forest Plan, which remains one of the most important pieces of forest management policy in the United States. The 17 national forests governed by the plan are vital for the wellbeing of both people and wildlife in the region—in addition to offering numerous ecosystem services like clean air and water, they provide local communities with many tangible economic benefits. As such, an amendment to the Northwest Forest Plan should consider the needs of both people and the environment.

An amendment to the Northwest Forest Plan should pay particular attention to protecting mature and old-growth forests, which were not equally protected by the initial policy. These older forests offer unique habitat that species like the northern spotted owl and salmon need for survival, and are culturally important for many different communities—including Tribal Nations. These forests are increasingly rare in the United States, and face escalating threats from climate change impacts like fire, drought and insect damage.

To that end, an amendment should take specific steps to address severe wildfires. Since the Northwest Forest Plan's initial development, wildfires have grown exponentially in size, strength and frequency—far surpassing expectations. The Forest Service should reassess current management strategies in light of escalating wildfire threats and consider incorporating Indigenous cultural burning practices. In general, consultation with local Tribal Nations and incorporation of Indigenous Knowledge will be critical steps for the Forest Service to take in amending the Northwest Forest Plan.

Lastly, an amendment should consider the Pacific Northwest's current socioeconomic landscape and the importance that national forests play in the regional economy. Tourism and recreation draw more people to the region than ever before, spurring job creation and growth in rural economies. An amendment should be sensitive to the socioeconomic needs of local communities and build a modern forest restoration workforce to protect these forests for generations to come.

Thank you for considering local voices in amending the Northwest Forest Plan.

Harleysville, PA 19438-3502

I am pleased that the U.S. Forest Service is preparing to amend the Northwest Forest Plan, which remains one of the most important pieces of forest management policy in the United States. The 17 national forests governed by the plan are vital for the wellbeing of both people and wildlife in the region—in addition to offering numerous ecosystem services like clean air and water, they provide local communities with many tangible economic benefits. As such, an amendment to the Northwest Forest Plan should consider the needs of both people and the environment.

An amendment to the Northwest Forest Plan should pay particular attention to protecting mature and old-growth forests, which were not equally protected by the initial policy. These older forests offer unique habitat that species like the northern spotted owl and salmon need for survival, and are culturally important for many different communities—including Tribal Nations. These forests are increasingly rare in the United States, and face escalating threats from climate change impacts like fire, drought and insect damage.

To that end, an amendment should take specific steps to address severe wildfires. Since the Northwest Forest Plan's initial development, wildfires have grown exponentially in size, strength and frequency—far surpassing expectations. The Forest Service should reassess current management strategies in light of escalating wildfire threats and consider incorporating Indigenous cultural burning practices. In general, consultation with local Tribal Nations and incorporation of Indigenous Knowledge will be critical steps for the Forest Service to take in amending the Northwest Forest Plan.

Lastly, an amendment should consider the Pacific Northwest's current socioeconomic landscape and the importance that national forests play in the regional economy. Tourism and recreation draw more people to the region than ever before, spurring job creation and growth in rural economies. An amendment should be sensitive to the socioeconomic needs of local communities and build a modern forest restoration workforce to protect these forests for generations to come.

Thank you for considering local voices in amending the Northwest Forest Plan.

I am pleased that the U.S. Forest Service is preparing to amend the Northwest Forest Plan, which remains one of the most important pieces of forest management policy in the United States. The 17 national forests governed by the plan are vital for the wellbeing of both people and wildlife in the region—in addition to offering numerous ecosystem services like clean air and water, they provide local communities with many tangible economic benefits. As such, an amendment to the Northwest Forest Plan should consider the needs of both people and the environment.

An amendment to the Northwest Forest Plan should pay particular attention to protecting mature and old-growth forests, which were not equally protected by the initial policy. These older forests offer unique habitat that species like the northern spotted owl and salmon need for survival, and are culturally important for many different communities—including Tribal Nations. These forests are increasingly rare in the United States, and face escalating threats from climate change impacts like fire, drought and insect damage.

To that end, an amendment should take specific steps to address severe wildfires. Since the Northwest Forest Plan's initial development, wildfires have grown exponentially in size, strength and frequency—far surpassing expectations. The Forest Service should reassess current management strategies in light of escalating wildfire threats and consider incorporating Indigenous cultural burning practices. In general, consultation with local Tribal Nations and incorporation of Indigenous Knowledge will be critical steps for the Forest Service to take in amending the Northwest Forest Plan.

Lastly, an amendment should consider the Pacific Northwest's current socioeconomic landscape and the importance that national forests play in the regional economy. Tourism and recreation draw more people to the region than ever before, spurring job creation and growth in rural economies. An amendment should be sensitive to the socioeconomic needs of local communities and build a modern forest restoration workforce to protect these forests for generations to come.

Thank you for considering local voices in amending the Northwest Forest Plan.

Sarasota, FL 34239-4026

I am pleased that the U.S. Forest Service is preparing to amend the Northwest Forest Plan, which remains one of the most important pieces of forest management policy in the United States. The 17 national forests governed by the plan are vital for the wellbeing of both people and wildlife in the region—in addition to offering numerous ecosystem services like clean air and water, they provide local communities with many tangible economic benefits. As such, an amendment to the Northwest Forest Plan should consider the needs of both people and the environment.

An amendment to the Northwest Forest Plan should pay particular attention to protecting mature and old-growth forests, which were not equally protected by the initial policy. These older forests offer unique habitat that species like the northern spotted owl and salmon need for survival, and are culturally important for many different communities—including Tribal Nations. These forests are increasingly rare in the United States, and face escalating threats from climate change impacts like fire, drought and insect damage.

To that end, an amendment should take specific steps to address severe wildfires. Since the Northwest Forest Plan's initial development, wildfires have grown exponentially in size, strength and frequency—far surpassing expectations. The Forest Service should reassess current management strategies in light of escalating wildfire threats and consider incorporating Indigenous cultural burning practices. In general, consultation with local Tribal Nations and incorporation of Indigenous Knowledge will be critical steps for the Forest Service to take in amending the Northwest Forest Plan.

Lastly, an amendment should consider the Pacific Northwest's current socioeconomic landscape and the importance that national forests play in the regional economy. Tourism and recreation draw more people to the region than ever before, spurring job creation and growth in rural economies. An amendment should be sensitive to the socioeconomic needs of local communities and build a modern forest restoration workforce to protect these forests for generations to come.

Thank you for considering local voices in amending the Northwest Forest Plan.

Santa Barbara, CA 93110-1251

I am pleased that the U.S. Forest Service is preparing to amend the Northwest Forest Plan, which remains one of the most important pieces of forest management policy in the United States. The 17 national forests governed by the plan are vital for the wellbeing of both people and wildlife in the region—in addition to offering numerous ecosystem services like clean air and water, they provide local communities with many tangible economic benefits. As such, an amendment to the Northwest Forest Plan should consider the needs of both people and the environment.

An amendment to the Northwest Forest Plan should pay particular attention to protecting mature and old-growth forests, which were not equally protected by the initial policy. These older forests offer unique habitat that species like the northern spotted owl and salmon need for survival, and are culturally important for many different communities—including Tribal Nations. These forests are increasingly rare in the United States, and face escalating threats from climate change impacts like fire, drought and insect damage.

To that end, an amendment should take specific steps to address severe wildfires. Since the Northwest Forest Plan's initial development, wildfires have grown exponentially in size, strength and frequency—far surpassing expectations. The Forest Service should reassess current management strategies in light of escalating wildfire threats and consider incorporating Indigenous cultural burning practices. In general, consultation with local Tribal Nations and incorporation of Indigenous Knowledge will be critical steps for the Forest Service to take in amending the Northwest Forest Plan.

Lastly, an amendment should consider the Pacific Northwest's current socioeconomic landscape and the importance that national forests play in the regional economy. Tourism and recreation draw more people to the region than ever before, spurring job creation and growth in rural economies. An amendment should be sensitive to the socioeconomic needs of local communities and build a modern forest restoration workforce to protect these forests for generations to come.

Thank you for considering local voices in amending the Northwest Forest Plan.

I am pleased that the U.S. Forest Service is preparing to amend the Northwest Forest Plan, which remains one of the most important pieces of forest management policy in the United States. The 17 national forests governed by the plan are vital for the wellbeing of both people and wildlife in the region—in addition to offering numerous ecosystem services like clean air and water, they provide local communities with many tangible economic benefits. As such, an amendment to the Northwest Forest Plan should consider the needs of both people and the environment.

An amendment to the Northwest Forest Plan should pay particular attention to protecting mature and old-growth forests, which were not equally protected by the initial policy. These older forests offer unique habitat that species like the northern spotted owl and salmon need for survival, and are culturally important for many different communities—including Tribal Nations. These forests are increasingly rare in the United States, and face escalating threats from climate change impacts like fire, drought and insect damage.

To that end, an amendment should take specific steps to address severe wildfires. Since the Northwest Forest Plan's initial development, wildfires have grown exponentially in size, strength and frequency—far surpassing expectations. The Forest Service should reassess current management strategies in light of escalating wildfire threats and consider incorporating Indigenous cultural burning practices. In general, consultation with local Tribal Nations and incorporation of Indigenous Knowledge will be critical steps for the Forest Service to take in amending the Northwest Forest Plan.

Lastly, an amendment should consider the Pacific Northwest's current socioeconomic landscape and the importance that national forests play in the regional economy. Tourism and recreation draw more people to the region than ever before, spurring job creation and growth in rural economies. An amendment should be sensitive to the socioeconomic needs of local communities and build a modern forest restoration workforce to protect these forests for generations to come.

Thank you for considering local voices in amending the Northwest Forest Plan.

I am pleased that the U.S. Forest Service is preparing to amend the Northwest Forest Plan, which remains one of the most important pieces of forest management policy in the United States. The 17 national forests governed by the plan are vital for the wellbeing of both people and wildlife in the region—in addition to offering numerous ecosystem services like clean air and water, they provide local communities with many tangible economic benefits. As such, an amendment to the Northwest Forest Plan should consider the needs of both people and the environment.

An amendment to the Northwest Forest Plan should pay particular attention to protecting mature and old-growth forests, which were not equally protected by the initial policy. These older forests offer unique habitat that species like the northern spotted owl and salmon need for survival, and are culturally important for many different communities—including Tribal Nations. These forests are increasingly rare in the United States, and face escalating threats from climate change impacts like fire, drought and insect damage.

To that end, an amendment should take specific steps to address severe wildfires. Since the Northwest Forest Plan's initial development, wildfires have grown exponentially in size, strength and frequency—far surpassing expectations. The Forest Service should reassess current management strategies in light of escalating wildfire threats and consider incorporating Indigenous cultural burning practices. In general, consultation with local Tribal Nations and incorporation of Indigenous Knowledge will be critical steps for the Forest Service to take in amending the Northwest Forest Plan.

Lastly, an amendment should consider the Pacific Northwest's current socioeconomic landscape and the importance that national forests play in the regional economy. Tourism and recreation draw more people to the region than ever before, spurring job creation and growth in rural economies. An amendment should be sensitive to the socioeconomic needs of local communities and build a modern forest restoration workforce to protect these forests for generations to come.

Thank you for considering local voices in amending the Northwest Forest Plan.

I am pleased that the U.S. Forest Service is preparing to amend the Northwest Forest Plan, which remains one of the most important pieces of forest management policy in the United States. The 17 national forests governed by the plan are vital for the wellbeing of both people and wildlife in the region—in addition to offering numerous ecosystem services like clean air and water, they provide local communities with many tangible economic benefits. As such, an amendment to the Northwest Forest Plan should consider the needs of both people and the environment.

An amendment to the Northwest Forest Plan should pay particular attention to protecting mature and old-growth forests, which were not equally protected by the initial policy. These older forests offer unique habitat that species like the northern spotted owl and salmon need for survival, and are culturally important for many different communities—including Tribal Nations. These forests are increasingly rare in the United States, and face escalating threats from climate change impacts like fire, drought and insect damage.

To that end, an amendment should take specific steps to address severe wildfires. Since the Northwest Forest Plan's initial development, wildfires have grown exponentially in size, strength and frequency—far surpassing expectations. The Forest Service should reassess current management strategies in light of escalating wildfire threats and consider incorporating Indigenous cultural burning practices. In general, consultation with local Tribal Nations and incorporation of Indigenous Knowledge will be critical steps for the Forest Service to take in amending the Northwest Forest Plan.

Lastly, an amendment should consider the Pacific Northwest's current socioeconomic landscape and the importance that national forests play in the regional economy. Tourism and recreation draw more people to the region than ever before, spurring job creation and growth in rural economies. An amendment should be sensitive to the socioeconomic needs of local communities and build a modern forest restoration workforce to protect these forests for generations to come.

Thank you for considering local voices in amending the Northwest Forest Plan.

I am pleased that the U.S. Forest Service is preparing to amend the Northwest Forest Plan, which remains one of the most important pieces of forest management policy in the United States. The 17 national forests governed by the plan are vital for the wellbeing of both people and wildlife in the region—in addition to offering numerous ecosystem services like clean air and water, they provide local communities with many tangible economic benefits. As such, an amendment to the Northwest Forest Plan should consider the needs of both people and the environment.

An amendment to the Northwest Forest Plan should pay particular attention to protecting mature and old-growth forests, which were not equally protected by the initial policy. These older forests offer unique habitat that species like the northern spotted owl and salmon need for survival, and are culturally important for many different communities—including Tribal Nations. These forests are increasingly rare in the United States, and face escalating threats from climate change impacts like fire, drought and insect damage.

To that end, an amendment should take specific steps to address severe wildfires. Since the Northwest Forest Plan's initial development, wildfires have grown exponentially in size, strength and frequency—far surpassing expectations. The Forest Service should reassess current management strategies in light of escalating wildfire threats and consider incorporating Indigenous cultural burning practices. In general, consultation with local Tribal Nations and incorporation of Indigenous Knowledge will be critical steps for the Forest Service to take in amending the Northwest Forest Plan.

Lastly, an amendment should consider the Pacific Northwest's current socioeconomic landscape and the importance that national forests play in the regional economy. Tourism and recreation draw more people to the region than ever before, spurring job creation and growth in rural economies. An amendment should be sensitive to the socioeconomic needs of local communities and build a modern forest restoration workforce to protect these forests for generations to come.

Thank you for considering local voices in amending the Northwest Forest Plan.

Vanderbilt, MI 49795-9701

I am pleased that the U.S. Forest Service is preparing to amend the Northwest Forest Plan, which remains one of the most important pieces of forest management policy in the United States. The 17 national forests governed by the plan are vital for the wellbeing of both people and wildlife in the region—in addition to offering numerous ecosystem services like clean air and water, they provide local communities with many tangible economic benefits. As such, an amendment to the Northwest Forest Plan should consider the needs of both people and the environment.

An amendment to the Northwest Forest Plan should pay particular attention to protecting mature and old-growth forests, which were not equally protected by the initial policy. These older forests offer unique habitat that species like the northern spotted owl and salmon need for survival, and are culturally important for many different communities—including Tribal Nations. These forests are increasingly rare in the United States, and face escalating threats from climate change impacts like fire, drought and insect damage.

To that end, an amendment should take specific steps to address severe wildfires. Since the Northwest Forest Plan's initial development, wildfires have grown exponentially in size, strength and frequency—far surpassing expectations. The Forest Service should reassess current management strategies in light of escalating wildfire threats and consider incorporating Indigenous cultural burning practices. In general, consultation with local Tribal Nations and incorporation of Indigenous Knowledge will be critical steps for the Forest Service to take in amending the Northwest Forest Plan.

Lastly, an amendment should consider the Pacific Northwest's current socioeconomic landscape and the importance that national forests play in the regional economy. Tourism and recreation draw more people to the region than ever before, spurring job creation and growth in rural economies. An amendment should be sensitive to the socioeconomic needs of local communities and build a modern forest restoration workforce to protect these forests for generations to come.

Thank you for considering local voices in amending the Northwest Forest Plan.

I am pleased that the U.S. Forest Service is preparing to amend the Northwest Forest Plan, which remains one of the most important pieces of forest management policy in the United States. The 17 national forests governed by the plan are vital for the wellbeing of both people and wildlife in the region—in addition to offering numerous ecosystem services like clean air and water, they provide local communities with many tangible economic benefits. As such, an amendment to the Northwest Forest Plan should consider the needs of both people and the environment.

An amendment to the Northwest Forest Plan should pay particular attention to protecting mature and old-growth forests, which were not equally protected by the initial policy. These older forests offer unique habitat that species like the northern spotted owl and salmon need for survival, and are culturally important for many different communities—including Tribal Nations. These forests are increasingly rare in the United States, and face escalating threats from climate change impacts like fire, drought and insect damage.

To that end, an amendment should take specific steps to address severe wildfires. Since the Northwest Forest Plan's initial development, wildfires have grown exponentially in size, strength and frequency—far surpassing expectations. The Forest Service should reassess current management strategies in light of escalating wildfire threats and consider incorporating Indigenous cultural burning practices. In general, consultation with local Tribal Nations and incorporation of Indigenous Knowledge will be critical steps for the Forest Service to take in amending the Northwest Forest Plan.

Lastly, an amendment should consider the Pacific Northwest's current socioeconomic landscape and the importance that national forests play in the regional economy. Tourism and recreation draw more people to the region than ever before, spurring job creation and growth in rural economies. An amendment should be sensitive to the socioeconomic needs of local communities and build a modern forest restoration workforce to protect these forests for generations to come.

Thank you for considering local voices in amending the Northwest Forest Plan.

I am pleased that the U.S. Forest Service is preparing to amend the Northwest Forest Plan, which remains one of the most important pieces of forest management policy in the United States. The 17 national forests governed by the plan are vital for the wellbeing of both people and wildlife in the region—in addition to offering numerous ecosystem services like clean air and water, they provide local communities with many tangible economic benefits. As such, an amendment to the Northwest Forest Plan should consider the needs of both people and the environment.

An amendment to the Northwest Forest Plan should pay particular attention to protecting mature and old-growth forests, which were not equally protected by the initial policy. These older forests offer unique habitat that species like the northern spotted owl and salmon need for survival, and are culturally important for many different communities—including Tribal Nations. These forests are increasingly rare in the United States, and face escalating threats from climate change impacts like fire, drought and insect damage.

To that end, an amendment should take specific steps to address severe wildfires. Since the Northwest Forest Plan's initial development, wildfires have grown exponentially in size, strength and frequency—far surpassing expectations. The Forest Service should reassess current management strategies in light of escalating wildfire threats and consider incorporating Indigenous cultural burning practices. In general, consultation with local Tribal Nations and incorporation of Indigenous Knowledge will be critical steps for the Forest Service to take in amending the Northwest Forest Plan.

Lastly, an amendment should consider the Pacific Northwest's current socioeconomic landscape and the importance that national forests play in the regional economy. Tourism and recreation draw more people to the region than ever before, spurring job creation and growth in rural economies. An amendment should be sensitive to the socioeconomic needs of local communities and build a modern forest restoration workforce to protect these forests for generations to come.

Thank you for considering local voices in amending the Northwest Forest Plan.

In general, consultation with local Tribal Nations and incorporation of Indigenous Knowledge will be critical steps for the Forest Service to take in amending the Northwest Forest Plan.

Lastly, an amendment should consider the Pacific Northwest's current socioeconomic landscape and the importance that national forests play in the regional economy. Tourism and recreation draw more people to the region than ever before, spurring job creation and growth in rural economies. An amendment should be sensitive to the socioeconomic needs of local communities and build a modern forest restoration workforce to protect these forests for generations to come.

Thank you for considering local voices in amending the Northwest Forest Plan.

I am pleased that the U.S. Forest Service is preparing to amend the Northwest Forest Plan, which remains one of the most important pieces of forest management policy in the United States. The 17 national forests governed by the plan are vital for the wellbeing of both people and wildlife in the region—in addition to offering numerous ecosystem services like clean air and water, they provide local communities with many tangible economic benefits. As such, an amendment to the Northwest Forest Plan should consider the needs of both people and the environment.

An amendment to the Northwest Forest Plan should pay particular attention to protecting mature and old-growth forests, which were not equally protected by the initial policy. These older forests offer unique habitat that species like the northern spotted owl and salmon need for survival, and are culturally important for many different communities—including Tribal Nations. These forests are increasingly rare in the United States, and face escalating threats from climate change impacts like fire, drought and insect damage.

To that end, an amendment should take specific steps to address severe wildfires. Since the Northwest Forest Plan's initial development, wildfires have grown exponentially in size, strength and frequency—far surpassing expectations. The Forest Service should reassess current management strategies in light of escalating wildfire threats and consider incorporating Indigenous cultural burning practices. In general, consultation with local Tribal Nations and incorporation of Indigenous Knowledge will be critical steps for the Forest Service to take in amending the Northwest Forest Plan.

Lastly, an amendment should consider the Pacific Northwest's current socioeconomic landscape and the importance that national forests play in the regional economy. Tourism and recreation draw more people to the region than ever before, spurring job creation and growth in rural economies. An amendment should be sensitive to the socioeconomic needs of local communities and build a modern forest restoration workforce to protect these forests for generations to come.

Since the Northwest Forest Plan's initial development, wildfires have grown exponentially in size, strength and frequency—far surpassing expectations. The Forest Service should reassess current management strategies in light of escalating wildfire threats and consider incorporating Indigenous cultural burning practices. In general, consultation with local Tribal Nations and incorporation of Indigenous Knowledge will be critical steps for the Forest Service to take in amending the Northwest Forest Plan.

Lastly, an amendment should consider the Pacific Northwest's current socioeconomic landscape and the importance that national forests play in the regional economy. Tourism and recreation draw more people to the region than ever before, spurring job creation and growth in rural economies. An amendment should be sensitive to the socioeconomic needs of local communities and build a modern forest restoration workforce to protect these forests for generations to come.

Thank you for considering local voices in amending the Northwest Forest Plan.

I am pleased that the U.S. Forest Service is preparing to amend the Northwest Forest Plan, which remains one of the most important pieces of forest management policy in the United States. The 17 national forests governed by the plan are vital for the wellbeing of both people and wildlife in the region—in addition to offering numerous ecosystem services like clean air and water, they provide local communities with many tangible economic benefits. As such, an amendment to the Northwest Forest Plan should consider the needs of both people and the environment.

An amendment to the Northwest Forest Plan should pay particular attention to protecting mature and old-growth forests, which were not equally protected by the initial policy. These older forests offer unique habitat that species like the northern spotted owl and salmon need for survival, and are culturally important for many different communities—including Tribal Nations. These forests are increasingly rare in the United States, and face escalating threats from climate change impacts like fire, drought and insect damage.

To that end, an amendment should take specific steps to address severe wildfires. Since the Northwest Forest Plan's initial development, wildfires have grown exponentially in size, strength and frequency—far surpassing expectations. The Forest Service should reassess current management strategies in light of escalating wildfire threats and consider incorporating Indigenous cultural burning practices. In general, consultation with local Tribal Nations and incorporation of Indigenous Knowledge will be critical steps for the Forest Service to take in amending the Northwest Forest Plan.

Since the Northwest Forest Plan's initial development, wildfires have grown exponentially in size, strength and frequency—far surpassing expectations. The Forest Service should reassess current management strategies in light of escalating wildfire threats and consider incorporating Indigenous cultural burning practices. In general, consultation with local Tribal Nations and incorporation of Indigenous Knowledge will be critical steps for the Forest Service to take in amending the Northwest Forest Plan.

Lastly, an amendment should consider the Pacific Northwest's current socioeconomic landscape and the importance that national forests play in the regional economy. Tourism and recreation draw more people to the region than ever before, spurring job creation and growth in rural economies. An amendment should be sensitive to the socioeconomic needs of local communities and build a modern forest restoration workforce to protect these forests for generations to come.

Thank you for considering local voices in amending the Northwest Forest Plan.

I am pleased that the U.S. Forest Service is preparing to amend the Northwest Forest Plan, which remains one of the most important pieces of forest management policy in the United States. The 17 national forests governed by the plan are vital for the wellbeing of both people and wildlife in the region—in addition to offering numerous ecosystem services like clean air and water, they provide local communities with many tangible economic benefits. As such, an amendment to the Northwest Forest Plan should consider the needs of both people and the environment.

An amendment to the Northwest Forest Plan should pay particular attention to protecting mature and old-growth forests, which were not equally protected by the initial policy. These older forests offer unique habitat that species like the northern spotted owl and salmon need for survival, and are culturally important for many different communities—including Tribal Nations. These forests are increasingly rare in the United States, and face escalating threats from climate change impacts like fire, drought and insect damage.

To that end, an amendment should take specific steps to address severe wildfires. Since the Northwest Forest Plan's initial development, wildfires have grown exponentially in size, strength and frequency—far surpassing expectations. The Forest Service should reassess current management strategies in light of escalating wildfire threats and consider incorporating Indigenous cultural burning practices. In general, consultation with local Tribal Nations and incorporation of Indigenous Knowledge will be critical steps for the Forest Service to take in amending the Northwest Forest Plan.

Lastly, an amendment should consider the Pacific Northwest's current socioeconomic landscape and the importance that national forests play in the regional economy. These forests are increasingly rare in the United States, and face escalating threats from climate change impacts like fire, drought and insect damage.

To that end, an amendment should take specific steps to address severe wildfires. Since the Northwest Forest Plan's initial development, wildfires have grown exponentially in size, strength and frequency—far surpassing expectations. The Forest Service should reassess current management strategies in light of escalating wildfire threats and consider incorporating Indigenous cultural burning practices. In general, consultation with local Tribal Nations and incorporation of Indigenous Knowledge will be critical steps for the Forest Service to take in amending the Northwest Forest Plan.

Lastly, an amendment should consider the Pacific Northwest's current socioeconomic landscape and the importance that national forests play in the regional economy. Tourism and recreation draw more people to the region than ever before, spurring job creation and growth in rural economies. An amendment should be sensitive to the socioeconomic needs of local communities and build a modern forest restoration workforce to protect these forests for generations to come.

Thank you for considering local voices in amending the Northwest Forest Plan.

I am pleased that the U.S. Forest Service is preparing to amend the Northwest Forest Plan, which remains one of the most important pieces of forest management policy in the United States. The 17 national forests governed by the plan are vital for the wellbeing of both people and wildlife in the region—in addition to offering numerous ecosystem services like clean air and water, they provide local communities with many tangible economic benefits. As such, an amendment to the Northwest Forest Plan should consider the needs of both people and the environment.

An amendment to the Northwest Forest Plan should pay particular attention to protecting mature and old-growth forests, which were not equally protected by the initial policy. These older forests offer unique habitat that species like the northern spotted owl and salmon need for survival, and are culturally important for many different communities—including Tribal Nations. These forests are increasingly rare in the United States, and face escalating threats from climate change impacts like fire, drought and insect damage.

To that end, an amendment should take specific steps to address severe wildfires. An amendment to the Northwest Forest Plan should pay particular attention to protecting mature and old-growth forests, which were not equally protected by the initial policy. These older forests offer unique habitat that species like the northern spotted owl and salmon need for survival, and are culturally important for many different communities—including Tribal Nations. These forests are increasingly rare in the United States, and face escalating threats from climate change impacts like fire, drought and insect damage.

To that end, an amendment should take specific steps to address severe wildfires. Since the Northwest Forest Plan's initial development, wildfires have grown exponentially in size, strength and frequency—far surpassing expectations. The Forest Service should reassess current management strategies in light of escalating wildfire threats and consider incorporating Indigenous cultural burning practices. In general, consultation with local Tribal Nations and incorporation of Indigenous Knowledge will be critical steps for the Forest Service to take in amending the Northwest Forest Plan.

Lastly, an amendment should consider the Pacific Northwest's current socioeconomic landscape and the importance that national forests play in the regional economy. Tourism and recreation draw more people to the region than ever before, spurring job creation and growth in rural economies. An amendment should be sensitive to the socioeconomic needs of local communities and build a modern forest restoration workforce to protect these forests for generations to come.

Thank you for considering local voices in amending the Northwest Forest Plan.

I am pleased that the U.S. Forest Service is preparing to amend the Northwest Forest Plan, which remains one of the most important pieces of forest management policy in the United States. The 17 national forests governed by the plan are vital for the wellbeing of both people and wildlife in the region—in addition to offering numerous ecosystem services like clean air and water, they provide local communities with many tangible economic benefits. As such, an amendment to the Northwest Forest Plan should consider the needs of both people and the environment.

The 17 national forests governed by the plan are vital for the wellbeing of both people and wildlife in the region—in addition to offering numerous ecosystem services like clean air and water, they provide local communities with many tangible economic benefits. As such, an amendment to the Northwest Forest Plan should consider the needs of both people and the environment.

An amendment to the Northwest Forest Plan should pay particular attention to protecting mature and old-growth forests, which were not equally protected by the initial policy. These older forests offer unique habitat that species like the northern spotted owl and salmon need for survival, and are culturally important for many different communities—including Tribal Nations. These forests are increasingly rare in the United States, and face escalating threats from climate change impacts like fire, drought and insect damage.

To that end, an amendment should take specific steps to address severe wildfires. Since the Northwest Forest Plan's initial development, wildfires have grown exponentially in size, strength and frequency—far surpassing expectations. The Forest Service should reassess current management strategies in light of escalating wildfire threats and consider incorporating Indigenous cultural burning practices. In general, consultation with local Tribal Nations and incorporation of Indigenous Knowledge will be critical steps for the Forest Service to take in amending the Northwest Forest Plan.

Lastly, an amendment should consider the Pacific Northwest's current socioeconomic landscape and the importance that national forests play in the regional economy. Tourism and recreation draw more people to the region than ever before, spurring job creation and growth in rural economies. An amendment should be sensitive to the socioeconomic needs of local communities and build a modern forest restoration workforce to protect these forests for generations to come.

Thank you for considering local voices in amending the Northwest Forest Plan.

Caddo Mills, TX 75135-8238

I am pleased that the U.S. Forest Service is preparing to amend the Northwest Forest Plan, which remains one of the most important pieces of forest management policy in the United States. The 17 national forests governed by the plan are vital for the wellbeing of both people and wildlife in the region—in addition to offering numerous ecosystem services like clean air and water, they provide local communities with many tangible economic benefits. As such, an amendment to the Northwest Forest Plan should consider the needs of both people and the environment.

An amendment to the Northwest Forest Plan should pay particular attention to protecting mature and old-growth forests, which were not equally protected by the initial policy. These older forests offer unique habitat that species like the northern spotted owl and salmon need for survival, and are culturally important for many different communities—including Tribal Nations. These forests are increasingly rare in the United States, and face escalating threats from climate change impacts like fire, drought and insect damage.

To that end, an amendment should take specific steps to address severe wildfires. Since the Northwest Forest Plan's initial development, wildfires have grown exponentially in size, strength and frequency—far surpassing expectations. The Forest Service should reassess current management strategies in light of escalating wildfire threats and consider incorporating Indigenous cultural burning practices. In general, consultation with local Tribal Nations and incorporation of Indigenous Knowledge will be critical steps for the Forest Service to take in amending the Northwest Forest Plan.

Lastly, an amendment should consider the Pacific Northwest's current socioeconomic landscape and the importance that national forests play in the regional economy. Tourism and recreation draw more people to the region than ever before, spurring job creation and growth in rural economies. An amendment should be sensitive to the socioeconomic needs of local communities and build a modern forest restoration workforce to protect these forests for generations to come.

Thank you for considering local voices in amending the Northwest Forest Plan.

I am pleased that the U.S. Forest Service is preparing to amend the Northwest Forest Plan, which remains one of the most important pieces of forest management policy in the United States. The 17 national forests governed by the plan are vital for the wellbeing of both people and wildlife in the region—in addition to offering numerous ecosystem services like clean air and water, they provide local communities with many tangible economic benefits. As such, an amendment to the Northwest Forest Plan should consider the needs of both people and the environment.

An amendment to the Northwest Forest Plan should pay particular attention to protecting mature and old-growth forests, which were not equally protected by the initial policy. These older forests offer unique habitat that species like the northern spotted owl and salmon need for survival, and are culturally important for many different communities—including Tribal Nations. These forests are increasingly rare in the United States, and face escalating threats from climate change impacts like fire, drought and insect damage.

To that end, an amendment should take specific steps to address severe wildfires. Since the Northwest Forest Plan's initial development, wildfires have grown exponentially in size, strength and frequency—far surpassing expectations. The Forest Service should reassess current management strategies in light of escalating wildfire threats and consider incorporating Indigenous cultural burning practices. In general, consultation with local Tribal Nations and incorporation of Indigenous Knowledge will be critical steps for the Forest Service to take in amending the Northwest Forest Plan.

Lastly, an amendment should consider the Pacific Northwest's current socioeconomic landscape and the importance that national forests play in the regional economy. Tourism and recreation draw more people to the region than ever before, spurring job creation and growth in rural economies. An amendment should be sensitive to the socioeconomic needs of local communities and build a modern forest restoration workforce to protect these forests for generations to come.

Thank you for considering local voices in amending the Northwest Forest Plan.

I am pleased that the U.S. Forest Service is preparing to amend the Northwest Forest Plan, which remains one of the most important pieces of forest management policy in the United States. The 17 national forests governed by the plan are vital for the wellbeing of both people and wildlife in the region—in addition to offering numerous ecosystem services like clean air and water, they provide local communities with many tangible economic benefits. As such, an amendment to the Northwest Forest Plan should consider the needs of both people and the environment.

An amendment to the Northwest Forest Plan should pay particular attention to protecting mature and old-growth forests, which were not equally protected by the initial policy. These older forests offer unique habitat that species like the northern spotted owl and salmon need for survival, and are culturally important for many different communities—including Tribal Nations. These forests are increasingly rare in the United States, and face escalating threats from climate change impacts like fire, drought and insect damage.

To that end, an amendment should take specific steps to address severe wildfires. Since the Northwest Forest Plan's initial development, wildfires have grown exponentially in size, strength and frequency—far surpassing expectations. The Forest Service should reassess current management strategies in light of escalating wildfire threats and consider incorporating Indigenous cultural burning practices. In general, consultation with local Tribal Nations and incorporation of Indigenous Knowledge will be critical steps for the Forest Service to take in amending the Northwest Forest Plan.

Lastly, an amendment should consider the Pacific Northwest's current socioeconomic landscape and the importance that national forests play in the regional economy. Tourism and recreation draw more people to the region than ever before, spurring job creation and growth in rural economies. An amendment should be sensitive to the socioeconomic needs of local communities and build a modern forest restoration workforce to protect these forests for generations to come.

Thank you for considering local voices in amending the Northwest Forest Plan.

I am pleased that the U.S. Forest Service is preparing to amend the Northwest Forest Plan, which remains one of the most important pieces of forest management policy in the United States. The 17 national forests governed by the plan are vital for the wellbeing of both people and wildlife in the region—in addition to offering numerous ecosystem services like clean air and water, they provide local communities with many tangible economic benefits. As such, an amendment to the Northwest Forest Plan should consider the needs of both people and the environment.

An amendment to the Northwest Forest Plan should pay particular attention to protecting mature and old-growth forests, which were not equally protected by the initial policy. These older forests offer unique habitat that species like the northern spotted owl and salmon need for survival, and are culturally important for many different communities—including Tribal Nations. These forests are increasingly rare in the United States, and face escalating threats from climate change impacts like fire, drought and insect damage.

To that end, an amendment should take specific steps to address severe wildfires. Since the Northwest Forest Plan's initial development, wildfires have grown exponentially in size, strength and frequency—far surpassing expectations. The Forest Service should reassess current management strategies in light of escalating wildfire threats and consider incorporating Indigenous cultural burning practices. In general, consultation with local Tribal Nations and incorporation of Indigenous Knowledge will be critical steps for the Forest Service to take in amending the Northwest Forest Plan.

Lastly, an amendment should consider the Pacific Northwest's current socioeconomic landscape and the importance that national forests play in the regional economy. Tourism and recreation draw more people to the region than ever before, spurring job creation and growth in rural economies. An amendment should be sensitive to the socioeconomic needs of local communities and build a modern forest restoration workforce to protect these forests for generations to come.

Thank you for considering local voices in amending the Northwest Forest Plan.

I am pleased that the U.S. Forest Service is preparing to amend the Northwest Forest Plan, which remains one of the most important pieces of forest management policy in the United States. The 17 national forests governed by the plan are vital for the wellbeing of both people and wildlife in the region—in addition to offering numerous ecosystem services like clean air and water, they provide local communities with many tangible economic benefits. As such, an amendment to the Northwest Forest Plan should consider the needs of both people and the environment.

An amendment to the Northwest Forest Plan should pay particular attention to protecting mature and old-growth forests, which were not equally protected by the initial policy. These older forests offer unique habitat that species like the northern spotted owl and salmon need for survival, and are culturally important for many different communities—including Tribal Nations. These forests are increasingly rare in the United States, and face escalating threats from climate change impacts like fire, drought and insect damage.

To that end, an amendment should take specific steps to address severe wildfires. Since the Northwest Forest Plan's initial development, wildfires have grown exponentially in size, strength and frequency—far surpassing expectations. The Forest Service should reassess current management strategies in light of escalating wildfire threats and consider incorporating Indigenous cultural burning practices. In general, consultation with local Tribal Nations and incorporation of Indigenous Knowledge will be critical steps for the Forest Service to take in amending the Northwest Forest Plan.

Lastly, an amendment should consider the Pacific Northwest's current socioeconomic landscape and the importance that national forests play in the regional economy. Tourism and recreation draw more people to the region than ever before, spurring job creation and growth in rural economies. An amendment should be sensitive to the socioeconomic needs of local communities and build a modern forest restoration workforce to protect these forests for generations to come.

Thank you for considering local voices in amending the Northwest Forest Plan.

I am pleased that the U.S. Forest Service is preparing to amend the Northwest Forest Plan, which remains one of the most important pieces of forest management policy in the United States. The 17 national forests governed by the plan are vital for the wellbeing of both people and wildlife in the region—in addition to offering numerous ecosystem services like clean air and water, they provide local communities with many tangible economic benefits. As such, an amendment to the Northwest Forest Plan should consider the needs of both people and the environment.

An amendment to the Northwest Forest Plan should pay particular attention to protecting mature and old-growth forests, which were not equally protected by the initial policy. These older forests offer unique habitat that species like the northern spotted owl and salmon need for survival, and are culturally important for many different communities—including Tribal Nations. These forests are increasingly rare in the United States, and face escalating threats from climate change impacts like fire, drought and insect damage.

To that end, an amendment should take specific steps to address severe wildfires. Since the Northwest Forest Plan's initial development, wildfires have grown exponentially in size, strength and frequency—far surpassing expectations. The Forest Service should reassess current management strategies in light of escalating wildfire threats and consider incorporating Indigenous cultural burning practices. In general, consultation with local Tribal Nations and incorporation of Indigenous Knowledge will be critical steps for the Forest Service to take in amending the Northwest Forest Plan.

Lastly, an amendment should consider the Pacific Northwest's current socioeconomic landscape and the importance that national forests play in the regional economy. Tourism and recreation draw more people to the region than ever before, spurring job creation and growth in rural economies. An amendment should be sensitive to the socioeconomic needs of local communities and build a modern forest restoration workforce to protect these forests for generations to come.

Thank you for considering local voices in amending the Northwest Forest Plan.

Bellevue, WA 98006-2308

I am pleased that the U.S. Forest Service is preparing to amend the Northwest Forest Plan, which remains one of the most important pieces of forest management policy in the United States. The 17 national forests governed by the plan are vital for the wellbeing of both people and wildlife in the region—in addition to offering numerous ecosystem services like clean air and water, they provide local communities with many tangible economic benefits. As such, an amendment to the Northwest Forest Plan should consider the needs of both people and the environment.

An amendment to the Northwest Forest Plan should pay particular attention to protecting mature and old-growth forests, which were not equally protected by the initial policy. These older forests offer unique habitat that species like the northern spotted owl and salmon need for survival, and are culturally important for many different communities—including Tribal Nations. These forests are increasingly rare in the United States, and face escalating threats from climate change impacts like fire, drought and insect damage.

To that end, an amendment should take specific steps to address severe wildfires. Since the Northwest Forest Plan's initial development, wildfires have grown exponentially in size, strength and frequency—far surpassing expectations. The Forest Service should reassess current management strategies in light of escalating wildfire threats and consider incorporating Indigenous cultural burning practices. In general, consultation with local Tribal Nations and incorporation of Indigenous Knowledge will be critical steps for the Forest Service to take in amending the Northwest Forest Plan.

Lastly, an amendment should consider the Pacific Northwest's current socioeconomic landscape and the importance that national forests play in the regional economy. Tourism and recreation draw more people to the region than ever before, spurring job creation and growth in rural economies. An amendment should be sensitive to the socioeconomic needs of local communities and build a modern forest restoration workforce to protect these forests for generations to come.

Thank you for considering local voices in amending the Northwest Forest Plan.

I am pleased that the U.S. Forest Service is preparing to amend the Northwest Forest Plan, which remains one of the most important pieces of forest management policy in the United States. The 17 national forests governed by the plan are vital for the wellbeing of both people and wildlife in the region—in addition to offering numerous ecosystem services like clean air and water, they provide local communities with many tangible economic benefits. As such, an amendment to the Northwest Forest Plan should consider the needs of both people and the environment.

An amendment to the Northwest Forest Plan should pay particular attention to protecting mature and old-growth forests, which were not equally protected by the initial policy. These older forests offer unique habitat that species like the northern spotted owl and salmon need for survival, and are culturally important for many different communities—including Tribal Nations. These forests are increasingly rare in the United States, and face escalating threats from climate change impacts like fire, drought and insect damage.

To that end, an amendment should take specific steps to address severe wildfires. Since the Northwest Forest Plan's initial development, wildfires have grown exponentially in size, strength and frequency—far surpassing expectations. The Forest Service should reassess current management strategies in light of escalating wildfire threats and consider incorporating Indigenous cultural burning practices. In general, consultation with local Tribal Nations and incorporation of Indigenous Knowledge will be critical steps for the Forest Service to take in amending the Northwest Forest Plan.

Lastly, an amendment should consider the Pacific Northwest's current socioeconomic landscape and the importance that national forests play in the regional economy. Tourism and recreation draw more people to the region than ever before, spurring job creation and growth in rural economies. An amendment should be sensitive to the socioeconomic needs of local communities and build a modern forest restoration workforce to protect these forests for generations to come.

Thank you for considering local voices in amending the Northwest Forest Plan.

I am pleased that the U.S. Forest Service is preparing to amend the Northwest Forest Plan, which remains one of the most important pieces of forest management policy in the United States. The 17 national forests governed by the plan are vital for the wellbeing of both people and wildlife in the region—in addition to offering numerous ecosystem services like clean air and water, they provide local communities with many tangible economic benefits. As such, an amendment to the Northwest Forest Plan should consider the needs of both people and the environment.

An amendment to the Northwest Forest Plan should pay particular attention to protecting mature and old-growth forests, which were not equally protected by the initial policy. These older forests offer unique habitat that species like the northern spotted owl and salmon need for survival, and are culturally important for many different communities—including Tribal Nations. These forests are increasingly rare in the United States, and face escalating threats from climate change impacts like fire, drought and insect damage.

To that end, an amendment should take specific steps to address severe wildfires. Since the Northwest Forest Plan's initial development, wildfires have grown exponentially in size, strength and frequency—far surpassing expectations. The Forest Service should reassess current management strategies in light of escalating wildfire threats and consider incorporating Indigenous cultural burning practices. In general, consultation with local Tribal Nations and incorporation of Indigenous Knowledge will be critical steps for the Forest Service to take in amending the Northwest Forest Plan.

Lastly, an amendment should consider the Pacific Northwest's current socioeconomic landscape and the importance that national forests play in the regional economy. Tourism and recreation draw more people to the region than ever before, spurring job creation and growth in rural economies. An amendment should be sensitive to the socioeconomic needs of local communities and build a modern forest restoration workforce to protect these forests for generations to come.

Thank you for considering local voices in amending the Northwest Forest Plan.

Lastly, an amendment should consider the Pacific Northwest's current socioeconomic landscape and the importance that national forests play in the regional economy. Tourism and recreation draw more people to the region than ever before, spurring job creation and growth in rural economies. An amendment should be sensitive to the socioeconomic needs of local communities and build a modern forest restoration workforce to protect these forests for generations to come.

Thank you for considering local voices in amending the Northwest Forest Plan.

I am pleased that the U.S. Forest Service is preparing to amend the Northwest Forest Plan, which remains one of the most important pieces of forest management policy in the United States. The 17 national forests governed by the plan are vital for the wellbeing of both people and wildlife in the region—in addition to offering numerous ecosystem services like clean air and water, they provide local communities with many tangible economic benefits. As such, an amendment to the Northwest Forest Plan should consider the needs of both people and the environment.

An amendment to the Northwest Forest Plan should pay particular attention to protecting mature and old-growth forests, which were not equally protected by the initial policy. These older forests offer unique habitat that species like the northern spotted owl and salmon need for survival, and are culturally important for many different communities—including Tribal Nations. These forests are increasingly rare in the United States, and face escalating threats from climate change impacts like fire, drought and insect damage.

To that end, an amendment should take specific steps to address severe wildfires. Since the Northwest Forest Plan's initial development, wildfires have grown exponentially in size, strength and frequency—far surpassing expectations. The Forest Service should reassess current management strategies in light of escalating wildfire threats and consider incorporating Indigenous cultural burning practices. In general, consultation with local Tribal Nations and incorporation of Indigenous Knowledge will be critical steps for the Forest Service to take in amending the Northwest Forest Plan.

Lastly, an amendment should consider the Pacific Northwest's current socioeconomic landscape and the importance that national forests play in the regional economy. Tourism and recreation draw more people to the region than ever before, spurring job creation and growth in rural economies. An amendment should be sensitive to the socioeconomic needs of local communities and build a modern forest restoration workforce to protect these forests for generations to come.

The Forest Service should reassess current management strategies in light of escalating wildfire threats and consider incorporating Indigenous cultural burning practices. In general, consultation with local Tribal Nations and incorporation of Indigenous Knowledge will be critical steps for the Forest Service to take in amending the Northwest Forest Plan.

Lastly, an amendment should consider the Pacific Northwest's current socioeconomic landscape and the importance that national forests play in the regional economy. Tourism and recreation draw more people to the region than ever before, spurring job creation and growth in rural economies. An amendment should be sensitive to the socioeconomic needs of local communities and build a modern forest restoration workforce to protect these forests for generations to come.

Thank you for considering local voices in amending the Northwest Forest Plan.

I am pleased that the U.S. Forest Service is preparing to amend the Northwest Forest Plan, which remains one of the most important pieces of forest management policy in the United States. The 17 national forests governed by the plan are vital for the wellbeing of both people and wildlife in the region—in addition to offering numerous ecosystem services like clean air and water, they provide local communities with many tangible economic benefits. As such, an amendment to the Northwest Forest Plan should consider the needs of both people and the environment.

An amendment to the Northwest Forest Plan should pay particular attention to protecting mature and old-growth forests, which were not equally protected by the initial policy. These older forests offer unique habitat that species like the northern spotted owl and salmon need for survival, and are culturally important for many different communities—including Tribal Nations. These forests are increasingly rare in the United States, and face escalating threats from climate change impacts like fire, drought and insect damage.

To that end, an amendment should take specific steps to address severe wildfires. Since the Northwest Forest Plan's initial development, wildfires have grown exponentially in size, strength and frequency—far surpassing expectations. The Forest Service should reassess current management strategies in light of escalating wildfire threats and consider incorporating Indigenous cultural burning practices. In general, consultation with local Tribal Nations and incorporation of Indigenous Knowledge will be critical steps for the Forest Service to take in amending the Northwest Forest Plan.

Lastly, an amendment should consider the Pacific Northwest's current socioeconomic landscape and the importance that national forests play in the regional economy. Tourism and recreation draw more people to the region than ever before, spurring job creation and growth in rural economies. An amendment should be sensitive to the socioeconomic needs of local communities and build a modern forest restoration workforce to protect these forests for generations to come.

To that end, an amendment should take specific steps to address severe wildfires. Since the Northwest Forest Plan's initial development, wildfires have grown exponentially in size, strength and frequency—far surpassing expectations. The Forest Service should reassess current management strategies in light of escalating wildfire threats and consider incorporating Indigenous cultural burning practices. In general, consultation with local Tribal Nations and incorporation of Indigenous Knowledge will be critical steps for the Forest Service to take in amending the Northwest Forest Plan.

Lastly, an amendment should consider the Pacific Northwest's current socioeconomic landscape and the importance that national forests play in the regional economy. Tourism and recreation draw more people to the region than ever before, spurring job creation and growth in rural economies. An amendment should be sensitive to the socioeconomic needs of local communities and build a modern forest restoration workforce to protect these forests for generations to come.

Thank you for considering local voices in amending the Northwest Forest Plan.

I am pleased that the U.S. Forest Service is preparing to amend the Northwest Forest Plan, which remains one of the most important pieces of forest management policy in the United States. The 17 national forests governed by the plan are vital for the wellbeing of both people and wildlife in the region—in addition to offering numerous ecosystem services like clean air and water, they provide local communities with many tangible economic benefits. As such, an amendment to the Northwest Forest Plan should consider the needs of both people and the environment.

An amendment to the Northwest Forest Plan should pay particular attention to protecting mature and old-growth forests, which were not equally protected by the initial policy. These older forests offer unique habitat that species like the northern spotted owl and salmon need for survival, and are culturally important for many different communities—including Tribal Nations. These forests are increasingly rare in the United States, and face escalating threats from climate change impacts like fire, drought and insect damage.

To that end, an amendment should take specific steps to address severe wildfires. Since the Northwest Forest Plan's initial development, wildfires have grown exponentially in size, strength and frequency—far surpassing expectations. The Forest Service should reassess current management strategies in light of escalating wildfire threats and consider incorporating Indigenous cultural burning practices.
