7/21/2024 23:23	Nicole Drawsky	94515	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

7/21/2024 21:15	Leah LaGrotta	21114	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
7/21/2024 21:13	Gabriella Elkaim		I am adding my voice to the following message written by advocates for old growth forests, because I believe these forests are an important part of our landscape, national heritage, and environmental future: Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
7/21/2024 18:11	Kelsey Kaplan	98034	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

7/21/2024 15:38	Cecilia Dapino	43221	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. With so many patches of forest across the US decimated by clear cutting logging practices, there is ample space for the logging industry to grow their own trees to fulfill demand while leaving mature and old groth forests. Let's work towards US sustainable logging!

These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
7/21/2024 13:24	Eleanor Broglie	20765	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

7/21/2024 11:16	Jonah Marsh	84010	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond. I 100% stand for everything said above this and earnestly hope you all consider my opinion in your decision making as a US citizen. Thank you.

All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
7/21/2024 10:04	Leif Tanner	95064	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
7/21/2024 9:03	Tralee Chapman	61008	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
7/21/2024 7:05	L M	04701	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
7/21/2024 2:44	John Favors	97420	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
7/21/2024 0:39	Kate Yarbrough	92646	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond. With climate change an ever growing and
7/20/2024 23:07	Tristine Lam	72201	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
7/20/2024 22:27	Aqsa Anwar	46208	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
7/20/2024 20:05	Yusuf Shehata	50613	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
7/20/2024 18:47	Robbie Bits	17602	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
7/20/2024 17:57	Rebecca Baldi	84115	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
7/20/2024 17:28	Tyler Wellens	55414	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. 7/20/2024 17:18	Dirk Last	55114	As a forestry graduate student, I've spent countless hours studying Minnesota's mature forests, witnessing their critical role in filtering drinking water, providing wildlife habitats, and storing carbon. These forests also enhance ecosystem resilience to fire and help regulate temperatures. However, threats such as climate change and commercial logging jeopardize these benefits. Cutting down old-growth trees deprives us of their beauty and ecological value. The proposed National Old-Growth Amendment by the Forest Service fails to protect these vital trees adequately. It allows for logging under ambiguous terms, risking the loss of our oldest forests. For these amendments to gain my support, the final version must: \t1.\tEnd logging of old-growth trees in national forests. \t2.\tStop the commercial exchange of old-growth trees. \t3.\tEstablish protections for mature forests to ensure their preservation for future generations.

No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

7/20/2024 16:57	Christopher Allen	10003	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
7/20/2024 16:38	Taylor Shipley	52332	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

7/20/2024 16:12	Taylor Sparbanie	53202	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
7/20/2024 15:49	Julian Brown	44143	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
7/20/2024 15:07	Shasta Love	12487	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
7/20/2024 14:35	Chanelle Obrien	96001	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
7/20/2024 14:20	Erin Davila	01468	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

7/20/2024 14:20	Laura S	29601	Hey! Im another person asking you to truly protect nature and old-growth trees and forests. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Cutting down forests screw with our biodiversity. It destroys one of our biggest climate emergency fighters. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond. Best regards, Laura S
7/20/2024 14:19	Jenna Barrett	90505-4627	Mature and old-growth trees are not easily replaceable. When one is cut, its replacement may take a lifetime to grow to the same stage. These trees have unique benefits to the environment and the world over younger trees, providing better shelter for wildlife and greater resistance to forest fires. The also have a unique beauty. In many parts of the world, these forests are dying out, as if people show concern at all, they tend to focus simply on the net number of trees cut vs planted. The current draft proposal for the National Old-Growth Amendment fails to do adequately protect mature and old growth trees, with too many loopholes and ambiguous language that could allow logging to continue by both the Forest Service and commercial interests. I would like to see an amendment that meets these points: 1. Commercial logging of old growth trees should not be allowed. 2.The Forest Service should stop the logging of old-growth trees. 3. More explicit protections must be created to not just maintain, but actually grow mature forests, given how much has already been lost. Thank you for reading.

7/20/2024 14:10	Carla Lei	33131	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
7/20/2024 13:59	Jordan Kailey	97007	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
7/20/2024 13:59	Mary Flores	93277	My comments in addition to the form are that we can't reverse time and care should be taken now to keep our nation healthy and beautiful. For current and future generations but also as respect for previous generations. Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

7/20/2024 13:54	Kalyssa Rude	80821	Hello! Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests. 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond. Thank you!
7/20/2024 13:53	Ellen Bryant	64110	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These are impacts that are extremely important to me, as a pediatrician who advocates for the future of our nation's youth! These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
7/20/2024 13:47	Sierra Sisler	80104	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
7/20/2024 13:40	Paula Norato	02155	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
7/20/2024 13:33	Aishah Saleh	95361	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
7/20/2024 13:27	Ramon Chavez	95953	Please consider the following when making your assessment. Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
7/20/2024 13:23	Sarah Mikkelson	48198	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
7/20/2024 13:18	Rebecca Naughton	52804	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. And these trees are not replaceable. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. 7/20/2024 13:09	Lee Keenan	94605	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
7/20/2024 13:04	Audrey Rickmon	45322	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

7/20/2024 12:53	Kayla Caudill	47037	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

7/20/2024 12:49	Amanda Ellexson	85014	Our mature and old-growth trees and forests play a crucial role in filtering our drinking water, providing homes for wildlife, and protecting our climate by absorbing and storing tons of carbon each year. They also enhance ecosystem resilience to fire and help regulate forest temperatures. However, these invaluable forests face threats from climate change and commercial logging. Cutting down our oldest trees robs us of their benefits, beauty, and majesty. These trees hold greater value standing tall in our forests. The proposed National Old-Growth Amendment gives the Forest Service a chance to protect these vital trees. Unfortunately, the current draft proposal falls short. The policy proposals leave room for the Forest Service to cut down old-growth trees and send them to mills. They allow agency staff the discretion to manage old growth out of existence under the guise of "proactive stewardship" goals. Additionally, the ambiguous language could justify continued commercial logging of old growth in the Tongass National Forest. None of the proposed alternatives would adequately protect our oldest trees and forests. To support these amendments, I believe the final version must address these key issues: 1. The Forest Service must end the logging of old-growth trees across our national forests. 2. The Forest Service must cease the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3. The Forest Service must establish protections for mature forests and trees to ensure an increase in old growth for future generations. Thank you for your time.

The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
7/20/2024 12:44	Melissa Schwab	20001	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond. I've only lived in urban areas. I grew up near the Long Island Pine Barrens, and now live near Rock Creek Park. Despite everything else, our love of trees in such urban areas persists. I want to see the rest of our country's beautiful forests and for them to thrive.

They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

7/20/2024 12:32	Drake Willis	75760	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
7/20/2024 12:23	Marianne Mencher	08553	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

7/20/2024 12:14	Mariann Tilton	05489	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
7/20/2024 12:04	Katie Mei	94089	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

7/20/2024 11:50	Cory Hayes	97304	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
7/20/2024 11:50	Erin Laybe	44223	To whom it concerns, Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
7/20/2024 11:43	Sara DeMars	15857	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond. Please save our trees! We want to love them for generations to come.
7/20/2024 11:38	Austin Loveless	55075	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

7/20/2024 11:37	Catherine Wassenberg	75219	When visiting Canada last year, one of our stops was to a forest for a hike. At the base of the trail was a plaque, saying due to logging old growth forests over 100 years old account for less than 4% of the land they used to occupy. We closely guard our Redwoods, why not other old growth forests? Old growth trees filter drinking water, are homes for wildlife, and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
7/20/2024 11:31	Alexa Schinderle	48822	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
