7/20/2024 11:28	Alexis Harper	74011	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
7/20/2024 11:28	Jo Kiser		Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. 7/20/2024 11:23	Shelby Logsdon	98155	As the child of a 30 year Forest Service worker, this cause is extremely important to me. We must protect mature and old-growth forests for present and future generations. No more logging of old growth should be occurring, period. Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
7/20/2024 11:16	Chloe Serafin	37215	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

7/20/2024 11:10	Megan Kassebaum	98801	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
7/20/2024 11:04	Gina Kay	97707	I have my bachelors in ecological engineering and can say with authority that mature and old-growth trees and forests filter drinking water for communities, provide homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire, help regulate forest temperatures and affect the precipitation cycle. Threats to our mature and old-growth forests include a changing climate and commercial logging and mining operations. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest living species. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an incredible opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The current policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the current proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would adequately protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests immediately and without exception. 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be logged by anyone or sent to any mill. 3.The Forest Service must establish protections for mature forests and add properly spaced trees to increase the amount of old growth for our children and generations beyond.

The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

7/20/2024 10:55	Soofia Khan	70115	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. We need these trees for our future. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. 7/20/2024 10:45	Amanda Windsor		ATTN: Forest Service I am writing to you via climate-forests.org as a concerned citizen who cares about the protection of our existing natural environment and the preservation that will enable it to continue to grow. I implore you to reconsider the current amendments and revise them in favor of old growths and mature forests for the following reasons: Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. They are some of the most beautiful and critical parts of our natural environment. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. I cannot support these amendments unless the necessary changes are made to address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond. Thank you for your time and attention.
7/20/2024 10:44	Ashtin Greene	57501	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

7/20/2024 10:35	Joshua Mitchell	71292	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
7/20/2024 10:27	Ace Bilton	57702	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
7/20/2024 10:11	Selina Marroquín	78207	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
7/20/2024 9:42	Chrissy Dipalma	08844	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

7/20/2024 9:24	Meghan Hayes	60614	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

7/20/2024 9:16	Kelsie Keene	22645	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
7/20/2024 9:02	Marisa Goco	21044	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
7/20/2024 8:47	Marilyn Elrod	95348	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
7/20/2024 8:35	Jennifer Paquette	29210	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
7/20/2024 8:20	Jordan McLerran	37130	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
7/20/2024 8:03	Rebecca Shelton	20151	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
7/20/2024 7:34	Stephanie Allen	48446	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
7/20/2024 7:05	Theresa Nilles	51232	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
7/20/2024 5:57	Samantha Wellman	98201	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
7/20/2024 5:21	Mary Murray	54220	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
7/20/2024 4:13	Aleks Clark	98037	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
7/20/2024 3:32	Tobin Smith	37407	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
7/20/2024 3:07	Sara Ritchey	14425	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

7/20/2024 2:31	Gilberto Bustos	77396	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
7/20/2024 1:58	Queenie Ho	94530	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

7/20/2024 1:26	Christina deVecchis	06489	Preserving forests is essential to the health of the American people and the planet. Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests. 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond. Please protect our old growth trees and draft a measure which ensures they are around for future generations.
7/20/2024 0:50	Bridget Gorman	60457	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. 7/20/2024 0:32	Crystal DiMiceli	33912	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
7/19/2024 23:46	Silas Mihm	30677	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
7/19/2024 23:19	Rachael Letney	93532	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1. The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

7/18/2024 23:32	Shaylee Behrmann	84120	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging these trees deprives us of the benefits and beauty of our largest, oldest trees. Your draft proposal fails to protect these trees and forests. The proposal includes many opportunities to send these trees to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. It contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass. I support a policy for our national forests that will: 1.End the logging of old-growth trees and in old-growth stands where fire is infrequent. 2.End the commercial exchange of old-growth trees. No old-growth trees should be sent to mills. 3.Establish protections for mature forests and trees to increase the amount of old growth for the future. Please make the decision to stop logging to keep our trees!
7/18/2024 10:56	TChristopher Gardner	80907	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife.
