2024-08-17 22:13:09	Thelma Anyador	75042	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
2024-08-17 21:31:47	Amy Albertson	49001	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
2024-08-17 20:50:08	Rose Campsite	77009	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

2024-08-17 19:26:21	Zavier Concannon	98607	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
2024-08-17 18:15:17	Ximena Leal		Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. 2024-08-17 17:20:25	Christine Martinez	33054	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

2024-08-17 16:16:23	Lara Fletcher	49401	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
2024-08-17 15:33:56	Charlotte Bartley	80018	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
2024-08-17 14:58:49	Allison Pestoff	23325	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
2024-08-17 14:16:15	lilybet carter	23323	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. As a final comment, I must add that old growth trees become the basis for a whole forest ecosystem, as they support a wide range of species, processes and unique interactions that cannot be easily replaced because they take decades, sometimes centuries to develop.

For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
2024-08-17 13:43:29	Olivia Graves-Pichla		Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3. The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond. Thank you.
2024-08-17 13:07:30	Brianna Ma	V3B7L4	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
2024-08-17 12:25:36	Ilyass Boukhris	87000 (France)	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. 2024-08-17 11:48:57	Stella Milam	22032	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
2024-08-17 11:21:29	Yusuf Demir	95200	Are you mad forest Why are you cutting them trees ur supposed to protect them
2024-08-17 11:21:02	mia klono	48197	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

2024-08-17 10:53:42	Diane Pasta	98198	I am writing about the importance of protecting our mature and old-growth forests. These trees and forests filter drinking water for communities, provide homes for wildlife, protect our climate by absorbing and storing tons of carbon every year. They also boost ecosystem resilience to fire and help regulate forest temperatures. In the face of the growing reality of climate instability and the disproportionate impact of first-world nations, everything we do to protect these resources is essential. We must eliminate logging of these forest! The draft National Old-Growth Amendment proposal fails to do direct the Forest Service to protect our mature and old-growth trees. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. The final amendments must end the logging of old-growth trees across our national forests. The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. We need protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

2024-08-17 9:58:45	Mika Todt	07260	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldests trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
2024-08-17 9:07:42	Maxime Beaulieu	G2g2c4	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
2024-08-17 8:01:36	Libby Marsh	IV36 3XJ	I am only 14 years old, but one of my dreams is to go to America and visit the beautiful national parks that you have there. But, if we do not save the trees the wildlife will struggle and there will be no more beauty in these national parks. Please don't just think in the present, look towards the future and the generations to come, think of your grandchildren having to live with the stories of ancient trees having been robbed of the privilege to see them in with their own eyes, just because of convenience. I and the rest of my generation beg you to reconsider.

2024-08-17 7:53:53	Piethra Mansur	22715-480	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
2024-08-17 6:24:18	Eleonore Riel	94121	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
2024-08-17 4:11:32	Mahari Rodrigo	M20 1HS	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

2024-08-17 1:17:46	Bryce Town	49088	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond. Trees help me live yâ all. Donâ t cut them down to make more commercial property. Weâre all gonna die someday, we might as well breathe in fresh air outside while the few elite sit back on their power-hungry fifth condo. Think about those less fortunate. Selflessness
2024-08-17 0:14:54	Autumn Ehler	56308	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond. Iâ m sure of you ask anyone at randomâ giving them the choice between saving a tree and providing materials to them derived from that same treeâ they would choose to save the tree.

With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

2024-08-16 22:55:17	Rane Warren	48282	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
2024-08-16 21:59:01	MarAa Luna	92750	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
2024-08-16 19:57:09	Micah Sheinberg	84105	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. 2024-08-16 19:15:37	Othea Borsha	11421	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
2024-08-16 19:15:23	Paul Peak	65713	Trees should only be cut down when necessary and when cut down should be replaced this would keep the world healthy and thriving making it easier for all

None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

2024-08-16 18:45:05	Victor Rodriguez	78733	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
2024-08-16 18:07:38	Amara Correal	94607	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
2024-08-16 17:34:59	Cass Tice	93955	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
2024-08-16 16:59:31	Madison Wilson	98040	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. 2024-08-16 16:23:51	Julia Attridge	84020	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond. Please save our trees!
2024-08-16 15:46:27	Miranda Woodburn	18634	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
2024-08-16 15:19:33	Ravi K		Save the trees! Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
2024-08-16 14:38:34	Sinclair Kennedy-Nolle	10506	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond. I love trees but support advancing civilizations with a little hard work both are possible.

None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
2024-08-16 13:23:51	Sophia Chen	95119	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
2024-08-16 12:57:28	Calla Shanbaum	60609	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. 2024-08-16 12:30:41	Davis Bruneau	48823	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
2024-08-16 11:54:34	Kristen Moreno	90815	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. 2024-08-16 11:29:25	Sep Boeren		Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
2024-08-16 11:07:28	Nirvana Mejia	07628	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
2024-08-16 10:40:23	Stephen Haw	92656	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
2024-08-16 10:10:10	Jonathan Morley	60449	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

2024-08-16 9:28:16	Manuel Arias	77083	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
2024-08-16 8:49:54	Claudy Dehelean		Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
2024-08-16 8:03:20	Lily Reed	44094	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
2024-08-16 7:12:38	Hima Singhvi	M4y1n3	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
2024-08-16 6:06:06	Julie Chatain		Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
2024-08-16 4:33:07	Damon Cross	38501	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
2024-08-16 3:47:35	Sarah Fuss	98102	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
2024-08-16 2:58:46	Olga Jackson		Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
2024-08-16 2:03:50	Eleanor Bucher	17071	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. Please don't kill these trees who are older than time. They live and breathe and keep us all alive. Nothing is worth murdering such an incredible part of our collective human history. I want there to be trees to show my children, and air they can breathe.

For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
2024-08-16 1:17:06	Christian Kiss	T3B3V8	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing. With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.

With the proposed National Old-Growth Amendment, the Forest Service has an opportunity to protect our mature and old-growth trees; but the current draft proposal fails to do so. The policy proposals include numerous opportunities for the Forest Service to cut old-growth trees and send them to the mill. All of the proposed alternatives allow agency staff the discretion to manage old growth out of existence in pursuit of "proactive stewardship" goals. They also contain ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. None of the Alternatives proposed would protect our oldest trees and forests. For me to support these amendments, I consider it necessary that the final amendments address these deficiencies: 1.The Forest Service must end the logging of old-growth trees across our national forests 2.The Forest Service must end the commercial exchange of old-growth trees logged on forestlands managed by the agency. No old-growth trees should be sent to mills. 3.The Forest Service must establish protections for mature forests and trees to increase the amount of old growth for our children and generations beyond.
2024-08-16 0:32:52	Sierra Kelemen	T6W0P7	Mature and old-growth trees and forests filter drinking water for communities, are homes for wildlife and protect our climate by absorbing and storing tons of carbon every year. These trees and forests also boost ecosystem resilience to fire and help regulate forest temperatures. Threats to our mature and old-growth forests include a changing climate and commercial logging. Cutting down our oldest trees deprives Americans of the benefits, beauty and majesty of our largest, oldest trees. These trees are worth more standing.
