Scott Killops	97215	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass. The final record of decision should: 1. End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types. 2. End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth. We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.

Donna Watson	57754	The logging old-growth trees causes a myriad of problems. Already we have too many industrial forests -- trees of the same width located approximately the same distance apart. This is not nature and the forests as created are not conducive to wildlife or plant life.It appears that the draft is vague and could later be twisted to justify continued commercial logging of old growth in the Tongass.:1.End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types.2.End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Peter Webb	29696	As a father, uncle, hunter and geographer, I am disturbed by the lack of stewardship and protection shown to old growth forest in my home of upstate South Carolina and in adjacent states. We will not get back the resource as it now stands; I ache my son, who loves the deep woods, as public land and resources are utilized for private commerce. Please listen to those of us who seek alternatives to clear cutting of old growth. Places like these are a part of the fabric of my family, and the next generation deserves to the same privilege.
Marian Fenimore	97219	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. James Hinsvark	97071	Keep our old growth forest alive and well. The water that permeates the soil creates the aquifer the entire Willamette valley draws from- for cities and farms. They keep the rivers flowing via rain catchment and fog drip. Shame on you for wanting to destroy them. Yes they will age out. Let them. Their value is so much more than lumber or wood chips.
Christopher Barnes	26263	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass.The final record of decision should: 1.End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types.2.End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth.We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.

name	zip	comment
Nicole Hayler	29664	The Draft National Old Growth Amendment (NOGA) Environmental Impact Statement is flawed. None of the DEIS alternatives will adequately protect old-growth trees and forests, and will allow old-growth trees to be sent to the mill and for agency staff to manage old-growth out of existence through "proactive stewardship" goals. In addition, the DEIS contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass National Forest. The final record of decision should:1. End the cutting of old-growth trees in all national forests and forest types, and end the cutting of any trees in old-growth stands in moist forest types.2. End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS also fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Mature forests can be protected consistent with addressing the threat of wildfire. Mature and old growth forests on our public lands must be protected to mitigate climate change and biodiversity loss. Mature and old growth forests must be protected for future generations. Please take this opportunity to protect old growth trees and forests on our public lands. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
Rick Bass	59935-9891	Dear U.S. Forest Service, I write to you from the "Black Ram" region of the Yaak, on the Canadian border, of the Kootenai National Forest, in northwest Montana. A valley that was once 50% old growth is not but 10%, and the KNF is racing to clearcut (with vast clearcuts consistently exceeding the Forest Plan) ancient forest in the name of "fuels reduction." The nation's artists have rallied and continue rallying to the Black Ram region – poets, luthiers, musicians, photographers – as do scientists to study this incredibly unique old primary forest. Ant short term footage gotten for an ASQ will pale in the damage such clearcutting would do to the USFS and the idea of our public lands providing any timber whatsoever. Black Ram is so inherently wrong that this single sale (being appealed by AFRC in their complaint to the Supreme Court) is capable of singlehandedly shutting down the U.S. Forest Service's timber sale program. The inability of the USFS to put their chainsaws down and admit they made a mistake at Unit 72 and in other old and mature forests in this proposed sale will be read about in history books for a hundred years hence. It is my fervent hope that NOGA protect Black Ram and all places like it, for reasons you've heard ad infinitum: carbon storage, biodiversity, water. And the integrity of your agency. Sincerely, Rick Bass Yaak Valley Forest Council
Kapuscinski Jack	20008	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass.The final record of decision should: 1.End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types.2.End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. PERIOD.Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth.We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
Claudia Ezinicki	01523	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass.The final record of decision should: 1.End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types.2.End any commercial exchange of old-growth trees. Carolyn Borkowski	03031	Dear Forest Service and USDA Officer: We are writing to provide our feedback on the Forest Service's Draft Environmental Impact Statement (EIS) regarding forest management. While we are encouraged by the recognition of the essential role that old-growth and mature forests play in combating climate change, we believe the Draft EIS does not go far enough in protecting these vital ecosystems.Old-growth and mature forests are irreplaceable. Not only do they capture and store significant amounts of carbon, but they also provide critical habitat for wildlife and contribute to the resilience of ecosystems facing increased wildfire risks. The removal of these trees, whether through logging or prescribed burns, weakens the natural defenses they provide. These forests should be preserved, not reduced, to support the fight against climate change and biodiversity loss.The Draft EIS does not sufficiently explore alternatives that prohibit the removal of mature and old-growth trees, nor does it fully consider the impacts that such management strategies would have on endangered species and ecosystems. Additionally, the resilience of these older trees to wildfires is not adequately acknowledged.We strongly urge the Forest Service to adopt a management approach that places a higher priority on preserving our remaining old-growth and mature forests. These forests are vital to the health of our environment and the future of our planet. Logging or thinning these trees in the name of fire management or other strategies should not be considered, as the long-term environmental costs far outweigh the short-term benefits.Thank you for considering our comments. We hope that future management plans will reflect the importance of preserving these forests for future generations.Sincerely, Michael and Carolyn BorkowskiAmherst, NH

The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass. The final record of decision should: 1. End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types. 2. End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth. We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
Faith Morgan	98368	PLEASE Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass. The final record of decision should: 1. End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types. 2. End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth. We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
Garrett Jones	97330	The Draft Environmental Impact Statement doesn't protect old growth forests to the extent they need it. They should be preserved completely, without interference or management. There is very little of wilderness left in the world; human population is affecting all areas of the globe. So we must protect what little is left, and this includes old growth trees. The Forest Service should adopt a record of decision that is a strengthened version of Alternative 3 in the Draft Environmental Impact Statement, modified to reflect comments received by the public and environmental organizations. Thank you.
Barbara Brenner	95501	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
Sara Steelman	15701	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass. The final record of decision should: 1. End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types. 2. End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth. We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
Joan Whittemore	30512	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth. We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.

Alden McMullen	97322	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass. The final record of decision should: 1. End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types. 2. End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth.We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
Christopher Lish	94903	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass.The final record of decision should: 1.End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types.2.End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass.The final record of decision should: 1.End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types.2.End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth.We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
Amith Aranha	15701	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass.The final record of decision should: 1.End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types.2.End any commercial exchange of old-growth trees. William Banke	05452	Mature and old-growth trees and forests are things of natural beauty. We should make every effort to preserve this natural resource and wonder. Logging is an important industry and America needs this natural resource, however, we must make special effort to preserve very old and large trees for our children, grandchildren, and generations that follow. To deprive them of this irreplaceable vision should be unthinkable. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass. The final record of decision should: 1. Jenny Holmes	97213-1345	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon and much more. First do no harm, a principle that guides medical care is just as important in forest management. Especially when those management actions reduce carbon.The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass. It is not adequate! Provisions to be included should be:1.Stop the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands. 2.End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill.Old-growth trees are worth more standing than cut, even when there are threats like fires. DEIS must, but doesn't protect mature trees and forests for the good of the American people. The Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth.We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
Thomas Derouin	54952	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
Tracy Thompson	54956	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass.The final record of decision should: 1.End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types.2.End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth.We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
Jeremy Nuttall	50020	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth. We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.

Amy Wolfberg		Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass.The final record of decision should: 1.End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types.2.End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth.We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.

Judy Meuth	99163	I am glad to see increased protection for old growth forests in the Northwest Forest Plan draft. Old growth forests do so many valuable environmental services from sequestering carbon dioxide to providing wildlife habitat, clean water, and recreational spaces. Mature forests are next in line and time to be our old growth forests. We need mature forests to be valued and protected as our "money in the bank" to become old growth. Please make sure the Northwest Forest Plan includes meaningful mature forests protection.
Jaqu Kunz	97202	Old growth forests are essential to their ecosystems. Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits of our largest, oldest trees.The Draft Environmental Impact Statement fails to protect old-growth trees and forests. ROBERT M. HUGHES	97333	As initially written, the 1994 Northwest Forest Plan was the largest and most comprehensive ecosystem management plan in the world. However, as implemented, it has failed to recognize existing science regarding the effects of logging on stream and riparian ecosystemsâparticularly those effects on stream temperatures, flows, wood delivery, and riparian wildlife. In addition, the agency has responded to the climate & biodiversity crises by treating forests as lumber sources instead of biodiversity refuges, climate buffers and secure carbon stores. I recommend the following with the hope that they will help stem the climate and biodiversity crises and offer wiser ways of managing forests globally: 1)Fully disclose and consider the cumulative local, regional, national, and global ecological effects in proposed forest plans, and plan implementation.2)Manage riparian reserves, key watersheds, and LSOG/mature stands for ecological integrity versus ecosystem services for humans. Eliminate riparian thinning.3)Implement explicit forest restoration or rehabilitation components, coupled with rigorous adaptive management planning and procedures. These components should include reducing road density in all watersheds (especially in erosion-sensitive areas and where they alter flows and fragment channels), reconnecting degraded stream channels to their floodplains, and prohibiting beaver trapping.4)Eliminate obfuscation of ecological language. Justification of logging by calling it 'restoration,' 'fire risk reduction,' 'biodiversity augmentation,' or 'canopy diversification' is illusory. 5)Provide clear management standards and mechanisms (formal Rules and numerical criteria for meeting them). 6)Require independent scientific peer review of all forest plans, environmental impact assessments, and environmental assessments.7)Establish and implement rigorous whistle-blower protectionsâinstead of finding ways to work around them.

Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth.We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
Allison Isaacs		Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass.The final record of decision should: 1.End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types.2.End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass.The final record of decision should: 1.End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types.2.End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth.We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
Allison Everitt	97301	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass.The final record of decision should: 1.End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types.2.End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
Mary Hayden	97045	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boosting resilience to fire, lowering temperatures, filtering drinking water, and sheltering wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The final decision must: 1. End the cutting of old-growth trees in all national forests and in all forest types. 2. End ALL commercial exchange of old-growth trees. In rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting old-growth trees to save them from potential threats is a false solution. With climate change happening NOW, their value as STANDING protection to ALL of us far surpasses any commercial value as lumber. The DEIS also fails to protect MATURE trees and forests. Mature forests and trees, that is, FUTURE old growth – must be protected from commercial logging so old growth lost to past mismanagement can be recovered. Protection of FUTURE old growth forests can be accomplished consistent with addressing the threat of fire. They must be protected to combat planetary heat and drought devastation and biodiversity loss. They must be protected to ensure that our children and grandchildren are able to experience and benefit from them. Protect our oldest trees and forests. Failure to do so ignores the objective of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments already received after last summer's advance notice of proposed rulemaking. It's the right thing to do.

Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
M Moderacki		Decisions regarding mature and old-growth trees and forests must consider the consequences of their loss in this time of a global climate crisis. What do you think the temperature will be around the world without old growth forests? Are you near-sighted or far-sighted? Decisions today have serious consequences tomorrow.You must know that mature trees absorb and store the most carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. These features cannot be replaced quickly. Are you prepared to take responsibility for stripping our country of its old growth forests? Please protect our oldest trees and forests.
Sally Siggins	27511	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Emily Demmin	94515	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass.The final record of decision should: 1.End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types.2.End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth.We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.

Katherine Jansen	20007	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass.The final record of decision should: 1.End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types.2.End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth.We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.

Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth. We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
Barbara Sanborn	98105	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass. The final record of decision should: 1. End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types. 2. End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass.The final record of decision should: 1.End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types.2.End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth.We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
Lily Puckey	15801	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass.The final record of decision should: 1.End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types.2.End any commercial exchange of old-growth trees. And they must be protected to ensure that our children are able to experience and enjoy old growth.We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
Susan McDonald	97403	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass.The final record of decision should: 1.End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types.2.End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth.We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
Robert Worrell	43224	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. Ajhana Crecelius	60614	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass.The final record of decision should: 1.End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types.2.End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth.We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.

Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth.We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
Vernon Mcdonald II	55330	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass.The final record of decision should: 1.End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types.2.End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass. The final record of decision should: 1.End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types.2.End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth. We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
Nimish Bhatt	98118	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass. The final record of decision should: 1.End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types.2.End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Kim Stafford	97219	The Forest Service should adopt a record of decision that is a strengthened version of Alternative 3 in the Draft Environmental Impact Statement. The modified recommended in detailed joint comments you are receiving from a coalition of national, regional, and local conservation and public interest organizations. Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass. The final record of decision should: 1. End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types. 2. End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth. Failure to protect our oldest trees and forests undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency previously received.
dana robinson	97206	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth.We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.

Sara Vanderford	33993	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass. The final record of decision should: 1. End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types. 2. End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass.The final record of decision should: 1.End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types.2.End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth.We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
William Reinig	99337	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass.The final record of decision should: 1.End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types.2.End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Michael Driscoll	60618	Old-growth trees and forests are vital - they capture carbon, enhance fire resilience, regulate climate, purify water, and support wildlife. Logging them deprives us of these crucial benefits. The current proposal fails to adequately protect old-growth forests. It still permits logging of old-growth trees and contains ambiguous language that could allow continued commercial exploitation. Musts: Prohibit cutting of old-growth trees in all national forests. End commercial use of old-growth trees, even those cut for safety reasons. The idea of cutting old-growth trees to protect them from potential threats is misguided. These trees are far more valuable standing. We must also safeguard mature forests - the old-growth of the future. This is essential for combating climate change, preserving biodiversity, and ensuring future generations can experience these magnificent ecosystems. We urge you to seize this opportunity to protect our oldest trees and forests. Failing to do so would undermine conservation goals and ignore widespread public support for their protection.
Francis Eatherington	97471	Old-growth forests, and big mature trees, help protect earth's climate by storing lots of carbon. They are also resilience to fire, filter my drinking water and shelter beloved wildlife. Please don't log them. Your DEIS fails to protect this ecosystem because it allows big, old trees to be sent to the mill. The "proactive stewardship" goals doesn't protect all old growth. The FEIS should just forbid any cutting inside any old-growth and native forests. Just leaving the big ones, and cutting and removing the rest of the forest, degrades the old growth left. If an old growth tree has to be cut because it is in the way of a road, or could fall on that new road, eliminate the road, not the tree. All mature forests and trees - future old growth - must be protected from logging in order to recover old growth that has been lost to past mismanagement. Big trees must be protected to aid in the fight against climate change and abundant species loss. Please take this opportunity to protect mature and old growth trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
Danelle Gutierrez	93513	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them ruins benefits and beauty of our largest, oldest trees. We need to protect them The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass. The final record of decision should: 1. End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types. 2. End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types. 2. End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees - future old growth - must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth. We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
Shannon Perneti	97202	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass. The final record of decision should: 1. End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types. 2. End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Richard Saretsky	91789	Dear U.S. Forest Service Chief Randy Moore: I'm writing to urge you to select an alternative in the final version of the National Old-Growth Amendment (NOGA) process that, with only very limited exceptions, prohibits the cutting of remaining old-growth trees in all National Forests. The few remaining ancient trees in California's twenty National Forests are our most fire-resistant and resilient remaining trees, are essential to sustaining water quality, provide critical habitat for wildlife and plant species as they deal with the stresses of a warming planet and habitat loss, and help us fight climate change. Unfortunately, none of the alternatives offered in the NOGA Draft Environmental Impact Statement (EIS) are sufficiently protective of our remaining ancient trees. Please act decisively to develop and select an alternative in the Final NOGA EIS that prohibits the cutting of all remaining old-growth trees except for addressing safety concerns and for other such very limited purposes.Thank you.
Kathryn Archibald	97225	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth.We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
Susan White	30548	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass.The final record of decision should: 1.End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types.2.End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth.We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.

Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth.We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
Rebecca Eisenberg	94303	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass.The final record of decision should: 1.End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types.2.End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Fergus Mclean	97431	Time is now to commit to preservation of old growth trees and mature stands, as Biden administration guidance on forest management policy provides. In Oregon, federal harvest of mature and old growth timber provides close to half of the state's official carbon footprint. Carbon capture provided by these trees and forests exceeds all other climate mitigation measures by orders of magnitude. Let's do this.
Lisa Read	97086	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass.The final record of decision should: 1.End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types.2.End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth.We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.

We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
Kristen Lowry	95688	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass. The final record of decision should: 1. End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types. 2. End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth. We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
Christine Grushas	60525	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth. We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
Jim Hemmingsen	97403	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass. The final record of decision should: 1. End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types. 2. End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth. We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
Stacy Trumbull	97520	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth. We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
Tanya Gilula	97222-8717	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass. The final record of decision should: 1. End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types. 2. End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass.The final record of decision should: 1.End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types.2.End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth.We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.

We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
Alan Allred	97214	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass. The final record of decision should: 1. End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types. 2. End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth. We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
Liesel Sylwester	97203	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. Beverly Moos	97702	Response to the Draft Environmental Impact Statement (DEIS): Biodiversity is necessary for all living things to survive. Old growth and mature trees provide this biodiversity. In addition, the climate crisis would benefit from keeping and caring for these trees for the amount of carbon they continue to store. Commercial exchange only encourages logging of these trees. There should be very specific protection standards, in perpetuity, that does not include commercial logging. Current and future logging projects need to be reviewed on their merit to prioritize NOT logging old growth and mature trees. Logging is not the only answer to maintaining a healthy forest that includes old growth and mature trees!

Howard A Brown	80497	Your talking points are far too subservient. Hazard trees are one of the worst (and questionably legal as well as counter-productive) policies of the Forest Disservice. Here in Summit County great damage has been done to far too many trails under this policy. Fuel reduction like hazard tree removal is counter-productive, likely increasing fire hazard https://wfca.com/wildfire-articles/deforestation-and-forest-fires/ Forest Harvest Can Increase Subsequent Forest Fire Severity 1 Carter Stone, 2 Andrew Hudak, Penelope Morgan 4 Timber production is economically as well as ecologically unviable in the arid West and in alpine ecosystems (both lead to very slow growth rates, as well as trees being worth far more for recreation and ecology than timber; around here, they pay to cut down the trees. In spruce/fir ecosystems, all spruce/fir and beetle-impacted lodgepole (therefor morphing to spruce-fir) should be considered old growth.
Donna Thompson	95531	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass. The final record of decision should: 1. End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types. 2. End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth. We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
Michelle Waters	95033	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Lora Rathbone	99354	RE: Forest Service National Old Growth Amendment I am writing to ask you for the strongest possible protections for mature and old-growth forests on federal land. We need to do all we can to slow climate change that is happening due to too much carbon being emitted into the atmosphere. One important way to reduce carbon emissions is to leave the mature and old-growth trees and forests that absorb and store carbon. They also are more fire resilient, lessening another source of carbon from wildfires. Mature forests also help regulate temperatures and filter drinking water while preventing erosion. They are more valuable left alone than removed for profit for a few. The Draft Environmental Impact Statement will not protect mature trees and forests, instead, allowing these trees to be harvested completely. The draft language could also be used to justify continued commercial logging of old growth in the Tongass. Mature forests and trees – future old growth – must be protected from the threat of commercial logging so that old growth that has been lost to past mismanagement can be recovered. They can be protected in a way that also addresses the threat of fire. We must also protect these forests to fight against worsening climate change and biodiversity loss, and to ensure that our children are able to experience and enjoy old growth. Please protect our oldest trees and forests. Do not ignore 500,000+ public comments the agency received last summer on the advance notice of proposed rulemaking. The final record of decision should: 1. End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types. 2. End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill.

End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types. 2. End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth. We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
Trisha Shade	95501	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass. The final record of decision should: 1. End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types. 2. End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass.The final record of decision should: 1.End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types.2.End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth.We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.

And they must be protected to ensure that our children are able to experience and enjoy old growth.We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
Matthew Reid	94515	We are in climate crisis. We need mature and old-growth trees and forests. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass.The final record of decision should: 1.End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types.2.End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth.Please protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
Joseph Alvarado	94122	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees, res ipsa loquitur.The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. Mark Henkels	97330	President Biden's 2022 executive order regarding Mature and Old Growth(MOG) forests should help ensure the long-term protection of this critical ecosystem that serves today's and tomorrow's citizens so importantly. The Forest Service should choose a strengthened version of Alternative 3 from the Draft Environmental Impact Statement, one that ensures that the great social benefits of MOG forests are not compromised by incentives or policies that encourage logging.The final record of decision should reflect the importance of the long-term carbon sequestration, temperature regulation, water resource protection that MOG forests provide. As a regular user of these older forests, I can absolutely state that the birdlife, plant life, fungi, and other aspects of these places are not replaceable in at least a lifetime once they have been cut. It would be a major setback for the quality and stability of our forests if we renew the cutting of old growth.Federal forest managers should absolutely stop cutting old growth trees and not endorse policies that consider logging such trees as a method of saving the forests they build.MOG forests are more valuable standing than cut and even when specific trees must be cut for specific safety reasons, for example, they should not be sold as timber. Creating any economic reward for cutting these old trees incentivizes prioritizing harvesting over the many other benefits and the long-term interests of our descendants.Mature forests must also be protected from the threat of commercial logging to promote the expansion of the old growth ecosystems and sequester carbon.Failure to protect our oldest trees and forests undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency previously received.
Kalyn Menfee	15701	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth.We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
Alicia Adrian	95525	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass.The final record of decision should: 1.End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types.2.End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth.We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.

Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth.We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
Sylvia Blake	94546	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass.The final record of decision should: 1.End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types.2.End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth.We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.

Laurie Neill	95567	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass.The final record of decision should: 1.End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types.2.End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass.The final record of decision should: 1.End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types.2.End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth.We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
Linda Nance	15701	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass.The final record of decision should: 1.End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types.2.End any commercial exchange of old-growth trees. Carlos Arnold	93455	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass.The final record of decision should: 1.End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types.2.End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth.We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.

We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
Sue Halligan	55082	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass. The final record of decision should: 1. End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types. 2. End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth. We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
J. Barry Gurdin	94122	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Rebecca Olson	97201	The Forest Service should adopt Alternative 3 in the Draft Environmental Impact Statement modified to ensure compliance with the direction of Executive Order 14072 and in consideration of the 500,000+ public comments the agency previously received. The modified alternative 3 should retain its strictures against old growth logging, especially not allowing commercial timber sales or sales to benefit national, state, or local government entities. Watersheds, riparian areas, and endangered species' habitats in old growth stands should receive absolute protection. Provisions should also be strengthened to protect indigenous traditional uses and management practices. The alternative should include clear procedures to allow exceptions for appropriate NFS forest management practices only when truly necessary, not simply for pursuit of "proactive stewardship" goals, and should absolutely not including logging for timber sales.

Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass.The final record of decision should: 1.End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types.2.End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth.We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
Elizabeth Darovic	93940-1909	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our our animal kin who depend on them have a fighting chance.We urge you to take this opportunity to protect the oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
Robert Brickzin	55443	Mature and old-growth trees and forests are necessary for a healthy environment, supporting wildlife and for their natural beauty and history. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement does not really protect old-growth trees and forests. The proposal allows old-growth trees to be cut down and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains unclear language that can be interpreted different ways. The final record of decision should end all cutting of old-growth trees in all national forests.They must be protected to ensure that our children are able to experience and enjoy old growth.Our history is rife with examples of people blindly destroying our natural resources in the name progress. We urge you to take this opportunity to protect our old growth trees. Logging companies are required to plant more trees than they harvest and these grow quickly. There is no reason to harvest old growth. It destroys our environment and is not sustainable. Thank you

The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass.The final record of decision should: 1.End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types.2.End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth.We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.

Cornelia Teed	98225	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass. The final record of decision should: 1. End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types. 2. End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Kelley Lindquist	55416	I have spent a lifetime of camping and hiking in old growth forests across the US. They are part of our greatest treasure and heritage on every level. Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass. The final record of decision should: 1. End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types. 2. End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. This issue is very important to me, and I am sharing my deep concern to with more than 100 voting friends of mine across the US. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth. We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.

Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth.We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
Esther Garvett	331252768	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass.The final record of decision should: 1.End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types.2.End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth.We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.

Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
Pamela Tate	60302	Mature, old-growth trees and forests absorb and store carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Allowing logging of these trees is a danger to all of us at a time when our planet is in need of more mature trees, not fewer The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal would allow old-growth trees to be managed out of existence in pursuit of what is being called "proactive stewardship" goals. The current draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass.The final record of decision should: 1.End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types.2.End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is not a solution. They are worth more standing than cut down and the biodiversity they promote is essential.Mature forests and trees – future old growth – must also be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth.I strongly urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.

Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth.We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
Jane Murphy	10920	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass.The final record of decision should: 1.End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types.2.End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass. The final record of decision should: 1. End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types. 2. End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth. We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
kimberly zamuda	82414	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass. The final record of decision should: 1. End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types. 2. End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Fred Senecal	97370	As a former research technician who has worked in the environmental sciences for more than 30 years, and a resident of the Corvallis area, in which is found beautiful stands of mature forests whose responsible management has been in question for the more than 40 years I have lived here, I am urging the powers that be to finally take a stand against greed and self-interest, and support legislation that ends once and for all the logging of old growth trees. By this time, I believe that the science has shown the benefits to the environment and future generations through the retention of these kinds of stands, and also made clear that the continued destruction of this valuable habitat only can result in a downward spiral of degradation that we and our children will come to regret. Please put an end to the logging of old growth forests!
Elli Kimbauer	95531	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth.We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.

Marco Pardi	30043	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass.The final record of decision should: 1.End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types.2.End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth.We urge you to take this opportunity to protect our oldest trees and forests. End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth. We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
Anita Merrigan	80487	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass. The final record of decision should: 1. End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types. 2. End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass.The final record of decision should: 1.End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types.2.End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth.We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
Michael Kavanaugh	94116	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
Karen Ashikeh	97003	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass.The final record of decision should: 1.End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types.2.End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth.We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
Linda Kleiner	97424	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. Graham Taylor	98178	Adopt, I ask, a ROD for the trees, A choice that strengthens what you now propose,Alternative three, yet altered to appeaseThe needs of all who call this land their home.A coalition strong, with voice and might,Has offered wisdom, counsel you must heed,For old-growth forests hold within their limbsA power vast to shelter and to breathe.These ancient trees, mature and grand of girth,They trap the heat that warms a changing earth,They still the fire's rage, and cool the air,They filter water, homes for creatures rare.But logging steals their strength and beauty wide,It strips from us the treasures that they hide. To lose the oldest trees would be to severThe living roots that bind us all together.Your plan allows the forest to be sold,To mills and men, for timber and for gold.In "stewardship" you cut them down to dust,And thus betray the public trust.Ambiguous the words you've set in place,Which grant excuse to log the Tongass space.We ask instead for justice and facts,That forests old be spared the logging axe.The final record should contain this plea:No cutting down of forests old and free.In national reserves, of every kind,No ancient stands should fall behind.No trade of wood, no marketplace exchange.For trees of old should get to age.If safety calls, and one must fall to ground,Then mill and market both must turn around.Old growth stands taller left untouched and free,Roots and branches stronger than can be.The threats they face don't warrant their demise,And stand against the climate's wild rise.Protect these forests, trees that still can grow,And grant the earth the time to heal, to slow.Let children yet to come, in years ahead,Behold these woods, where once their elders tread.If you should fail to safeguard trees so old,You breach the aim your mission must uphold.You turn your back on promises once made,And let the cries of half a million fade.Improve alt. 3. No cutting unless it serves an ecological benefit.
Linda Hadden	55443	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass.The final record of decision should: 1.End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types.2.End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth.We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
Sierra Siebert	95521	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass.The final record of decision should: 1.End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types.2.End any commercial exchange of old-growth trees. Cori Bucherl	98672	Hi there. I agree with the following form letter, but want to add my own personal comment here. It feels like a good faith effort into researching the benefits of old growth forests would result in us protecting them at all costs. We have plenty of tree farms. Let's harvest those 50 year old trees to build, rather than ravaging hundreds- and thousands-of-years-old forests and ecosystems that will never return in our lifetime, or even our grandchildren's lifetimes. We're smart monkeys - lets use those brains to find creative, sustainable ways to use the gifts of our forests, rather than destroying entire ecosystems for the convenience of a few trees. Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees.The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. karen klitz	89825	I am submitting comments on a draft of the National Old Growth Amendment. I support the No Action Alternative, but beyond that, MATURE AND OLD GROWTH FORESTS DON'T NEED ANY HUMAN MANAGEMENT, including burned forests, which have their own recovery processes and many special species dependent on the burned elements, including snags. These plants and ecosystems evolved and survived without humans for millennia. Mature and old-growth trees and forests are crucial for human mental health because they are deep in our evolutionary history, a wild environment where we can still absorb the quiet and calm we need to think and survive. Outside of us, mature and old-growth trees and forests also protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees.The final Record of Decision should:1. End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types.2. End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill.The extraction mentality has to change. To actually serve the public, all national forests should be converted to national parks. National Parks cost the taxpayer less and prevent the degradation and destruction of the public forests. Public polls show that the National Park Service is the top favorite government agency.We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.

Susanna DeFazio	97759-9885	The Forest Service should adopt a record of decision that is a strengthened version of Alternative 3 in the Draft Environmental Impact Statement as recommended in detailed joint comments you are receiving from a coalition of national, regional, and local conservation and public interest organizations. Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass. The final record of decision should: 1. End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types. 2. End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth. Failure to protect our oldest trees and forests undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency previously received.

Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
Robert Wright	97403	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement fails to protect old-growth trees and forests. The proposal allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass. The final record of decision should: 1. End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types. 2. End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth. We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.

John Larson	63128	A minimum of 5% of each national forest acreage should be identified and set aside as old growth stock or potential stock. That 5% should be made up of units no smaller than 2 mi.² these units should be managed only to address fire control. These unit should be excluded from any easement or long-term lease agreement with the USDA.

Nancy Ahnert	97405	Mature and old-growth trees and forests protect our climate by absorbing and storing carbon, boost resilience to fire, help regulate temperatures, filter drinking water and shelter wildlife. Logging them deprives us of the benefits and beauty of our largest, oldest trees. The Draft Environmental Impact Statement allows old-growth trees to be sent to the mill and allows agency staff to manage old-growth out of existence in pursuit of "proactive stewardship" goals. The draft also contains ambiguous language that could be used to justify continued commercial logging of old growth in the Tongass.The final record of decision should: 1.End the cutting of old-growth trees in all national forests and forest types and end the cutting of any trees in old-growth stands in moist forest types.2.End any commercial exchange of old-growth trees. Even in the rare circumstances where an old-growth tree is cut (e.g. public safety), that tree should not be sent to the mill. Cutting down old-growth trees to save them from potential threats is a false solution. They are worth more standing. The DEIS fails to protect mature trees and forests. Mature forests and trees – future old growth – must be protected from the threat of commercial logging in order to recover old growth that has been lost to past mismanagement. Protection of mature forests can be accomplished in a manner that is consistent with addressing the threat of fire. They must be protected to aid in the fight against worsening climate change and biodiversity loss. And they must be protected to ensure that our children are able to experience and enjoy old growth.We urge you to take this opportunity to protect our oldest trees and forests. Failure to do so undermines the objectives of this amendment, contravenes the direction of EO 14072, and ignores 500,000+ public comments the agency received on last summer's advance notice of proposed rulemaking.
