Comments: I have previously argued that the Custer Gallatin National Forest has to tell it like it is regarding recovery/restoration/regeneration/recruitment of forest cover under the emergent new conditions that are summarized as climate change. I have argued that a broad range of interested parties need your honesty on this matter. To your credit, you have given it some time in public meetings. It will be crucial for all concerned that you give it all due time and space in coming documents. To that end, I have uploaded relevant documents including a recent PNAS paper (Davis et) on recovery/restoration/regeneration/recruitment at low elevations. Today, I upload a document on that topic for the high elevation treeline.
