Comments

There is nothing in your DEIS volumes that shows time lapsed study that identifies an increase, stability, or decrease of your indicator species.

There are many instances in your DEIS volumes where writers have made comments about shooting, people, and vehicles and have not supplied any scientific evidence to support there opinions.

There is nothing in your DEIS volumes that identifies hot weather, cold weather, fire, rain, snow, or wind that affects the national forest or any of your indicator species.

There is no evidence provided in you DEIS volumes that supports reducing camping, shooting, driving, or any other activity that would have a positive effect on the plant, fish, or animals of the forest.

Your have plenty of opinions that lack scientific studies to prove the opinions

I suspect you have predetermined the out come you expect and have produced these inadequate volumes with the help of your chosen specialists to justify the end you have predetermined.

These volumes you have produce would never pass the scrutiny of a peer review. You are luck you are part of the Obama government and do not have to produce accurate Environmental Impact Statements that meet the quality of commercial organizations.

Please remove all opinions that do not have scientific studies produced by independent organizations. This request should have the effect of reducing your DEIS volumes to at total of 3 pages.

Please rewrite your document and provide proof of the indicator species, and all other species, change in population over time, provide proof that man (woman) interference in the forest has a positive or negative effect on the forest or the plants, fish, or animals of the forest.

Add in how the imporated elk and fish are changing the forest and the natural plants, fish, and animals for the better or worse.

Cannot wait to see you white wash answers.
