Comments: I am writing to share my thoughts on Midas Gold Idaho's Stibnite Gold project. There are many reasons why I am excited for Midas Gold's project to come to life and I hope through my comments you will understand why.

More than 10 million tons of spent ore and unlined tailings from previous mining are sitting, unlined in the valley near Meadow Creek at the site of the proposed Stibnite Gold Project. As water flows over this waste material, metals leach into the ground and surface. Therefore, we should not be surprised that the amount of arsenic and antimony in water near site vastly exceed levels that are considered acceptable for aquatic life standards. Midas Gold has a plan to mitigate the impacts of previous, unaffiliated mining projects to improve water quality and fish habitat. Among many other investments, Midas Gold would clean up the roughly 3 million tons of historical tailings and reprocess and properly store them in a state-of-the-art tailings facility. The company would also relocate the 7.5 million tons of used ore underneath the tailings facility liner systemic permanently separating it from interacting with water. These efforts to remove legacy materials will improve water quality, a finding reflected in your own agency's draft environmental impact statement. According to chapter 4, removing legacy tailings and waste improves water quality in Meadow Creek Valley (4.12 103-104).

Thank you for the thorough review of the Stibnite Gold Project. I urge you to now move forward and permit the mine using alternative 2, so Midas Gold can put Americans back to work.
