Title: Director

Comments: To Whom It Concerns,

Our Forests are our most valuable asset in the United States for Climate Change.

They are better at sequestering carbon than anything else we have.

Our Forests have become a National Treasure.

Our Forests are home to uncountable species of plants, wildlife, insects, fungi, and more.

They cool our hot summers and provide shade to streams and lakesides.

Our forests soak up extra rainfall in the winter and they give us fresh water throughout the year.

We clearcut our Forests and spray herbicides on the soil, which destroys all life.

We contaminate the water, which flows into the rivers, lakes, canals and bays, injuring the shellfish and salmon and other creatures.

When you drive by a clearcut forest, this is what you are seeing: the Death of an entire ecosystem.

Stop converting mature, natively generated forests into tree plantations and other man-made contrivances.

We are killing ourselves by killing our Forests.

It's not just about the money anymore, it's about Life.

SAVE the TREES
