Title:

Comments: Logging operations during the current climate crisis must be minimized as every tree, especially older growth trees and the forest community surrounding are efficient carbon sinks that must be maintained.

In addition, we are only just becoming aware of the mycorrhizal network that connects life in forest communities, and which is destroyed by logging. This fungal network connects trees, shares nutrients, and offers communication between species.

See for more info:

The human race can continue to view forests as a commodity, or accept that we are part of the living planet, and destroying that planet will (quickly now) lead to our own destruction.
