Comments: re: bison conservation Forest Plan

Please include provisions for migratory buffalo in the revised forest plan:

- * Adopt standards to manage habitat on America's National Forests to support viable populations and genetic diversity of migratory buffalo.
- * Assess local, traditional, and scientific knowledge of how migratory buffalo use America's National Forests. Biologists view buffalo as a keystone grassland species whose presence on the land enhances animal and plant diversity. In Hebgen Basin, buffalo seek out fire burned lodgepole pine forest and help restore fire-dependent habitats. Buffalo don't linger near water sources, making a positive contribution to watershed recovery.
- * Assess using migratory buffalo as an indicator species for grassland recovery, animal and plant diversity, and watershed restoration.
- * Update your long-term habitat plan to include a keystone wildlife species that has made their presence known on America's National Forests: America's last wild buffalo.
- * The National Forest Management Act requires the Custer-Gallatin National Forest to "provide for diversity of plant and animal communities based on the suitability and capability of the specific land area in order to meet overall multiple-use objectives." 16 U.S.C. 1604(g)(3)(B).
- * As a driver of biological diversity, the health of grasslands and watersheds, the buffalo are well suited to indicate whether key conditions on the forest are declining or improving based on the natural distribution and migrations of this native keystone species.
