Comments: In reading your document under budget and sustainability it states there is not enough money to maintain the current level of infrastructure. Yet there is no discussion on how adding additional features will be analyzed to ensure they can be properly maintained.

The document does not discuss how trails will be analyzed as to their maintenance costs based on the environment that they could be constructed in and their use.

There is a significant maintenance cost difference between a motorized trail built in gentler slopes with deep loam soils and a trail built in steep slopes in fragile highly erosive soils. How will this determination be made?

There is no discussion of what is the ecological carrying capacity or how that is determined. How will the Forest determine this level of capacity. The forest recognizes that other uses such as grazing, and timber have limits, the Forest needs to discuss on how this will be determined and do the analysis of the current activities and if any increase is available.
