Comments: Direct and comprehensive management of our forests must be revised. Must understand that a "let it burn" approach is not acceptable given the forest health conditions found across our nation's landscape. Instead we are need effectively responding to and reversing unnatural conditions in the forest, also respond to fires more effectively before they start by cleaning old growth allowing more timber sales. If forests are devastated by wildfire, we lose revenue and jobs, a myriad of ecological benefits we rely upon from our forests, and the traditional and cultural sustenance our forests have provided since time immemorial. Wild Fires create a toxic health risk to humans and wildlife. While the comparison is not completely equivalent, the average size of a fire on BIA-managed lands is one-third the size of fires on Forest Service land. Fire fuels in forest need weekly or monthly inspection team to respond to old growth to stop fires from damaging economic value and rehabilitate landscapes. Fires once start can come at a devastating financial and ecological cost. Rehabilitation costs are generally equal to the suppression cost, but can be as much as three times higher. We can help move the country forward to create a healthier, sustainable future for our forests and natural resources.
