Title:

Comments: One Meteorologist in 2008 said ; , Politicians have come to see global warming as a way to raise revenue by rationing CO2 production. Global warming as proclaimed by Al Gore and Co. is a hoax, Scientist Williams said that "there are 'strong and powerful counter-arguments' to the theories on global warming and carbon trading that are not being fully considered." "There is no proof that carbon dioxide is causing or precedes global warming," Williams wrote on August 15, 2008. "All indications are that the minor warming cycle finished in 2001 and that Arctic ice melting is related to cyclical orbit-tilt-axis changes in earth's angle to the sun," the risks associated with natural and man-made catastrophes, weather and climate, rejected the notion that there is a "consensus" on global warming. The fact was that the 'biotic' agents (man and other living organisms) had a very small role compared to the 'abiotic' (geological, geomorphologic, climatologic, planetary and hydrological) events like earthquakes, volcanic eruptions, tsunamis, movement of glaciers and landslides. In reality, rarely is there ever a last and final word in studies of complex systems such as earth's environment. Rather, science is a dynamic process based on the scientific method in which researchers test hypotheses leading to new discoveries, but also reexamine earlier theories and try to improve, build upon, or extend them. Environmental Sciences at Australia's James Cook University, in 2008. "As the climate change debate moves from the scientific to the political, it is important to stay with the facts. The bottom line is that humans cannot prevent global warming. Therefore, we should not be forced into emissions trading schemes, or any other scheme that sacrifices Australia's economic advantage and standard of living for the wrong reasons," Collins wrote on August 13, 2008. we should not be carried away by misconceptions about what is driving climate change. It's with the Earth itself . Another scientist, McElmurry wrote on August 7, 2008. "Packs of rats wait in that [rat] hole to reap trillions coming down it to fill advocates pockets. As a Meteorologist I find it scientifically Dishonest!" the claims of the effects are fantastically blown out of believable proportion, money we are about to spend on drastically reducing carbon dioxide will line the pockets of the environmentalists who have such expertise readily available at the right price. And some politicians are standing in line to fill their pockets with kick back money for large grants to the environmental experts, for the purpose of developing new ways to drastically reduce the emissions. In case you haven't noticed, it is an expanding profit-making industry, growing in proportion to the horror warnings by government officials and former vice-presidents. Many questions remain to be answered regarding the real significance of anthropogenic carbon dioxide as a climate forcing factor and related rising sea level consequences projected by the [UN] IPCC," Bell, who is internationally for his contributions to the design of space habitats and systems, including the International Space Station, wrote on June 18, 2008. "First, there is no incontrovertible evidence to support contentions that pre-industrial carbon dioxide levels were consistently lower than the 380 ppm recorded now. More than 90,000 published measurements carried out between 1812 and 1961 indicate that atmospheric levels were actually rising before the Industrial Revolution. They reached about 440 ppm in 1820, dropped to about 390 ppm by 1855, and rose back to about 440 ppm by 1940," Bell explained. "Cause and effect relationships between atmospheric carbon dioxide concentrations from all sources and global temperatures are inconclusive. "The National Oceanographic and Atmospheric Administration estimates that about 97 percent of that small amount originates from natural sources, and further, that all atmospheric carbon dioxide may account for less than 10 percent of total greenhouse influence. There is urgent need to put the phenomenon, which had not been triggered off suddenly, in the right perspective as today almost every human activity right from vehicular emissions to use of polythene is being linked to global warming which was a much larger event which started as soon as the Ice Age ended. The fact was that the 'biotic' agents (man and other living organisms) had a very small role compared to the 'abiotic' (geological, geomorphologic, climatologic, planetary and hydrological) events like earthquakes, volcanic eruptions, tsunamis, movement of glaciers and landslides. The atmosphere has periodic warming and cooling cycles. The sun is the primary source of energy impacting the earth's surface. Oceans are the main repository for CO2. They release CO2 as their temperature rises - just like your beer. .
