Comments: Pumping drinking water to the ski hill's reservoir is a poor use of this resource, when we could use water discharged from our wastewater treatment facilities. Reusing water in this way seems to be rejected by DPU for the reason that "it is not reliable." I suggest that reusing water is well worth the cost of making the system sufficiently reliable (and furthermore, this is not an application that needs high reliability). Our water is a limited resource, and we must re-think how we obtain and use it: just scaling up our existing water production system without investing in water reuse is short sighted and wasteful.
