Comments: Key Needs to Change!! You totally missed the impact of invasive species in both Social and Economic Sustainability and to provide for Ecological Sustainability. Weeds are increasing at a rate of 5% a year and taking over native plant communities in ever watershed and wilderness area we have. These are just the A and B listed species, not the C listed species. This is the most critical aspect of maintaining and restore ecological integrity of our landscapes. The forest has a poor inventory of the invasive species on the forest. Major outbreaks on every district; oxeye daisy, toadflax, knapweeds, houndstongue, thistle complex, and many more. This 10 times worse than Climate Change. Very critical oversight.

Missed the need for trail mtnc. of our non-motorized trails. Many have not been open for years. Why plan for new trails when we can't maintain the ones we have?

Lack of funding for wilderness and management should mean we do not need more wilderness to restrict more access to our National Forests. Trails are not maintained, erosion on old trails are common, invasive species are not being treated. We need to open the use of the wilderness areas. Riding a saddle club of 15 members for an hour through the wilderness does not cause damage. The 25 heart beat rule needs revised.
