Comments: A few more additions for the Species Assessments:
Carex leporinella is found in "Wetlands w/in spruce-fir ecosystems" (ie Grand Mesa).
Eriogonum coloradense is also found on calcareous substrates.
For Montane-Subalpine Riparian Woodlands - please include Seeps where mountain bladder fern, northern twayblade, and slender rock-break are more often found.

Lastly - purple marshlocks and Colorado wood-rush do NOT grow in lakes and reservoirs! They grow in fens and wetlands. Thanks for your patience!
