Title: Ms

Comments: I'm deeply concerned about the inevitable contamination of our precious water resources if fracking were to take place here. It is undeniable that fracking contaminates surface water and groundwater. The isotopic signature of natural gases has proved that methane found in the drinking water near fracking operations was of fossil origin, not from current biological activity. The presence of ethane and propane, constituents of natural gas that are not produced by microbes, also indicate that contamination to groundwater comes from nearby fracking.
