Comments: One of the most important things we can do to slow down the effects of climate change is to preserve wilderness areas. The trees and grasses capture carbon from the atmosphere, cutting down on carbon dioxide pollution. All life on earth is at risk if we do not take such measures.

As population on earth has increased, the impact on natural resources of all kinds has been devastating. There is a 'tomorrow' coming, and if we care about the quality of life of our grandchildren and great grandchildren, we must preserve wilderness areas that still exist. We must make them the best they can be so that they do survive!
