Comments: The Sunnyside Exploration plan of operations states that drilling operations will run 24/7. The plan also states that "lighting located at the drill rigs will be shielded and directed towards the ground to reduce visibility impacts.

The planned area of operations is located within the E1b lighting area (25 mile radius from the summit of Mount Hopkins.) which hosts the Whipple Observatory. This critical zone also includes the Fairborn Observatory. How will Sunnyside certify compliance with the extra light pollution abatement requirements within the zone and ensure they do not impinge upon the commercial, scientific and recreational uses of this dark-sky wilderness area?
