Comments: To whom it may concern:

As an Environmental Science and Biology instructor and studying this science I have seen that when you fragment habitats with the division of a road it shrinks the biodiversity of that habitat. This is due to a variety of species in that habitat that require more square footage than others and a road would restrict that and cause animal numbers to decrease due to less food, being killed on the road, less genetic diversity for mating which would cause disease, illness and a variety of other problems detrimental to the species. This is our last area of true wilderness. Please leave it alone for future generations as well as our well being
