Comments: We've hardly begun understanding America's temperate rainforests, but what we do know is that they have, in each square foot, the richest and most complex biological activity in the world. Clearcutting these trees is not only killing the forest but killing billions of organisms that make up this astoundingly complex interconnective ecosystem that impacts not only the forest but the waterways and ocean as well. Clearcut logging is an unfortunate inevitability right now, but if there are any forests that are to be logged, temperate rainforests are the absolute worst pick.
