Comments: Please adopt this plan and put it in action now! A well managed forest is better and healthier for the forest, and all of the animals, critters, fish, and bugs. More natural growth browse means better health, which makes surviving the harsh winter months easier for the wildlife. Managing the trees makes the trees that are growing have more nutrients, better growing conditions, and less susceptible to disease. Prescribed fire will help eliminate the threat of rapidly growing uncontrollable wildfires by removing the decades of fuel on the forest floor. When done correctly there is minimal harm to animals, minimal harm to trees, and all of the new plants that grow back a week or two after the burn is a buffet for wildlife! Instead of dead space forest where only some trees are growing, we can have a thriving forest full of healthy plants and animals!
