Comments: It is imperative that the USFS utilize sound forest management practices such as thinnings and prescribed burning to revitalize and hopefully add a necessary boost to so many wildlife species that depend on herbaceous growth and browse. Whitetail deer, turkey, grouse and numerous non-game species have all but disappeared in the mountains due to lack of habitat manipulation. Our forests have become biological deserts due to lack of activity and sound forest management. It is time that so called conservation and preservation organizations come to realize that our forests were aesthetically beautiful and healthy due to the activities of prior foresters, biologists and land management professionals and not by doing nothing. Doing nothing has left the forests stagnate and non-productive from a forestry and wildlife perspective. I fully support enacting sound forest management regimes to make these public areas more productive and healthier.
