Comments: I am not an expert at how to maintain a forest's health. I appreciate those folks who are and the science behind it. I understand the need for prescribed burns, thinning areas, controlling drainage/sediment and balancing the recreational opportunities of the forest with the environmental impact. Yes, the forests have survived millennia without human intervention, but I believe it is that exact human interaction with the forest that necessitates the need for some intervention and planning to maintain the forest's health.

I urge caution and a minimum amount of human intervention to avoid massive unintended changes to our forests.

I would like to see continuing public input concerning what happens to our public forests, especially when it impacts areas near where we call home.
