Comments: Re: Draft Air Quality Supplemental Report

In 2019 there was some indication that top die back and spotting on leaves might indicate that the ozone level might have been higher than usual in southern Lawrence County

221Ef and 221Ed, based on IRD observations often have differing PH levels which would impact soil response to both sulphur and NOx

Another modeled impact of climate change is increased thunder storms, the lighting in which can produce a flush of Nitrogen.
