Comments: Gentlemen;

This project appears to be proceeding as usual for fire danger mitigation projects elsewhere in Colorado, i.e thinning and pile burning as major components. While the end of reducing the danger of conflagratiuons is a good one, the FS needs to pay more attention to reducing CO2 emissions, or soil carbon loss into these kinds of projects. It seems to me that the location of this project close to a major resort area where people probably burn a lot for wood for practical home heating as well as esthetic purposes suggests at the very least that piles of thinning should be made available to the public for the above purpose to offset some of the cutting for firewood that would occur otherwise. Thanks for your consideration
