Comments: This is let the Forest Service understand that I, personally, perfer wild horses over cattle as fire suppressants. Ruminants are not healthy for the ecology of forests; horses, in contrast, with their one stomach, do not digest seeds thoroughly and do pass them on in their own fertilizer. Wild horses also roam some 20+ miles per day. As you can see, the amount of land alotted to the horses is nothing. It is healthier for human beings to not eat meat, it is healthier for our forests to not feed cattle, and the ranchers need to find some other business besides overgrazing our national forests. There are other things ranchers can do as raising cattle is on its way out. Too much damage to our planet due to cattle.I believe people prefer hiking and seeing wild horses as oposed to cattle, among other things. I wish the forest service would grow up and think in terms of ecology and what is healthy for our planet. Horses have been in America for hundreds of years without doing the damage that humankind is doing.
