Comments: The plan you propose for the "excess" horses seems like it is based on estimated, if not totally fabricated, numbers of these excess horses.

An accurate count, an accurate assessment of range conditions, and an accurate unbiased AML needs to be presented that takes Genetic viability into account. Forage forage allocations need to be refigured accurately without bias toward The wild horses that live in this area.

We know this is being done to move more cattle in once the horses Are out of the way.
