Title:

Comments: All of our natural areas have come under threat of becoming either mined or made commercial. Too many species world wide are now becoming extinct because of human invasion. With Earth warming faster than science thought would happen the extinction rate has risen from 1 per 5,000 years to 5,000 to one year.

Ecosystems need to remain in balance to survive. Eventually as ecosystems the planet that sustains humans will also crash.

Our 'Natural Wonders' need utmost protection not only here, but worldwide. It is wrong for humans to continue to believe we can survive this next extinction easily.
