Subject: Draft Assessment Comment: Change from the 2006 Forest Plan

To save the earth, we have to save the whole earth.

What has changed since the 2006 Wayne National Forest Plan is that the biology and ecology of the whole Earth have changed for the worse.

Since 2006, the earth has experienced increased human destruction, degradation, and diminishment. It's air, water, and soils are more polluted and poisoned. Biological life has been degraded and diminished.

Wayne National Forest is part of the biology and ecology of earth's ecosystem. Management activities since 2006 have contributed to the life-harming actions and effects to the world.

The need for change in the revised Wayne National Forest Plan is a paradigm shift to change away from and stop the programs, projects, and actions contributing to earth's biological and ecological destruction and poisoning.
