Comments: Perhaps I am missing something, but if I am understanding the documents correctly, what you are dealing with is essentially a man-made lake that was created by removing material which was used as part of a highway construction project.

Correct?

Okay, then the obvious solution to the problem is to simply FILL IN THE HOLE and restore the creek to its original natural state.

Consequently, the "pond" would no longer exist. You'd still have a parking lot, and a nice little loop trail, but no "pond".

Is the desired objective to restore fish habitat? Yes? No?

If the answer to that question is yes, then this is a no-brainer:

FILL IN THE POND and be done with it. Simple.

Thank you for your time and consideration.
