Comments: I am a concerned citizen and against mass harvesting of lumber in this region of the watershed. Nutrient runoff from forested land is an impactful nonpoint source. We must consider pollution of phosphorus, nitrates, and temperature affecting the north fork section of the nooksack river. How will this affect our new intake system for lake whatcom's drinking water resources and salmon populations in the middle fork? I would like to ask for a further environmental investigation of potentially costly repercussions and effects harvesting here will have on current water restoration projects.
