Comments: Given the complexity of this proposal, and the departure from practices of the past several decades, requirement of an EIS is critical. The specific issues I feel require analysis are the actual benefits to marbled murrelet and spotted owl that proponents of this project claim versus the benefits if the forest is left as is. Serious location-specific scientific reports need to be provided analyzing this issue. These reports need to include the background of the authors and the source of their funding to write the reports. The same needs to be provided for the huckleberry enhancement proposal. In the broader view of forest health and diversity and climate change, does it really make sense to remove trees in order to promote huckleberries. Lastly, has an attempt been made to analyze the effects on low-impact recreation in the area. Recreation is clearly a large source of income for residents of Glacier and the surrounding community.
