Comments: I cannot help asking myself why this interest in 2020 to keep on doing the same errors than we did in prior centuries. We already are suffering the consequences of those errors but it seems that we have not learnt anything from them.

A river dam was a technological advance for the last century. Not anymore in the 21st. Century. When building one we destroy many ecosystems and create an artificial river flow. We flood another areas that naturally are not supposed to be flooded. All for what? Energy.

But today we know about other forms of clean renewable energy resources that do not cause any ecosystem destruction. Let's use our intelligence to decide what is good for the natural world, and live in harmony with it.

No, to any new dam. Yes, to renewable energy resources, a field that we are just beginning to understand. Let's invest those tax dollars in something that does not cause destruction that will need generations to correct.

Man has an extraordinary intelligence that can provide answers for our needs. To look backwards to find solutions is a waste of time. Let's look back in order to not commit the same errors we did before. Let's leave the dams as a step forward for passed centuries.

But not for 2020. Thank you
