Title:

Comments: If you were to measure all the grass lawns across the United States, and then calculate how much water it takes to keep those lawns green, you might be shocked at the quantity. our planet puts an enormous amount of strain on water resources, this a fact. The result is also huge strain on animals, habitat, climate and so on. We have got to all pivot and start looking for alternatives to our addiction to water gluttony. Aurora and Colorado Springs are of course not the only culprits, but they are smart enough politically to recognize an opportunity for conservation.

The communities of Aurora and Colorado Springs should take action to reduce their water needs, and not destroy our Wilderness and rivers.

Please reduce the strain so our water supplies don't go down the drain! God's perfect creation is worth the trouble!
