Last name: Rice

Organization:

Title:

Comments: Having a holding pond for capturing heavy metal mining waste from operations is not compatible with the the water quality needed for the endangered species that inhabit the South Fork of the Salmon River. These settling ponds used in the mining industry have a long history of failure by releasing toxic fish killing heavy metal waste. These types of ponds are left after the mining companies have ceased operations after extracting the profitable minerals. The mining companies avoid responsibility for clean up by declaring bankruptcy.
