Comments: I have an MBA in Sustainable Business, am a current Brigade Tactical Analyst at the Army's National Training Center, and have fought fires with the California National Guard... So, I don't sound too crazy.

As a concept (alternative to fire), bring in herds of goats/sheep to eat the underbrush. This would also allow fertilization of the ground. "If" farms opt-in, they can feed their herd cheaply. If you geo-tag or use a "smart-collar" on a few alphas you could guide the herd through designated areas.

This is just a concept that would need to be tested before general and repeated use. But I believe it could be a safe, viable solution in the near future.
