Comments: I have been riding e-bikes on various mountain bike trails for years. The footprint that the e-bike leaves is the exact same as any regular bike. In fact often times an e-bike will leave less impact. Mud. The regular mountain bike rider will have to dismount and push leaving tire tracks and squishy foot prints. The e-biker will pedal right through smoothly. Snow and sand, same thing. Tough hills. Regular bike may grind backward, walk it up with cleats digging in etc. E-biker, ride up with no drama. The argument that e-bikes are too fast on the trail is wrong too. My younger regular bike riding pals are faster than me on pretty much all the trails. They are more nimble and quicker around turns. Me and e-bike buddies take it easier. Also, the e-bike typically has a larger tire and less air pressure. Once again causing less impact. With that, it is my experienced opinion that e-bikes should be welcomed everywhere that bicycles are allowed. Thank you.
