Comments: The exploratory drilling project will require plenty of water. Where is this water coming from? The water trucks are usually large 4000gallon to 6000 gallon trucks, these trucks will have to travel on at least 30 miles of dirt roads where the roads cannot accomodate vehicles going in both directions. All routes in have steep drops and are winding with poor forward visibilty in some cases. What is the proposed route for these trucks. Who will be monitoring this truck traffic? The area in question is used by outdoor enthusiasts of all kinds birders, hunters cammpers with RV's, etc.. Will the company be doing a traffic study? The Forest Servise needs to have some kind of protocol in place that will deal with the traffic before issuing any kind of permit for the exploration, otherwise, the Forest Service must assume all liability if there is any kind of vehicular accident caused by the frequency and size of the water trucks.
